The actual desired reamer diameter will be on the upper limit side of the median work tolerance, and will differ depending on diameter/ tolerance range/grade. Contact Sumitomo Engineering Dept. for more details.

SR S G 18.2 + 20 - 10 - A01 - F05 12R 1
(1) (2) (3) (4) (5) (6) (7) (8)

(1) SR Reamer	(5) Tolerance (μm) +/- or standard
(2) Small	(6) Approach Angle Code
(3) G = Straight, L = Lefthand helix	(7) Grade Symbol
(4) Workpiece Bore Diameter (mm)	(8) Coating Code

Specifying Inserts Using Desired Reamer Diameter

By adding a "Q" after the diameter, it is possible to specify exact desired reamer dimensions. Uncoated types are available within ±2μ, thin-coated layer types are available within ±3μ and thick-coated layer types are available within ±4μ.

SR S L 18.2 Q + 3 - 3 - A01 - F05 12R 1
(1) (2) (3) (4) (5) (6) (7) (8)

(1) SR Reamer	(5) Tolerance (μm) +/-(6)
(2) Small	Approach Angle Code
(3) G = Straight, L = Lefthand helix	(7) Grade Symbol
(4) Median Desired Cutting Edge Diameter (mm)	(8) Coating Code

Small Holder

- Single insert screw improves insert replacement efficiency
- Capable of high-torque (high-load) machining

SD (Center Bolt Clamp)

· Can be clamped using one center bolt to improve work efficiency
· Applicable to high-torque (high-load) machining

■ Troubleshooting

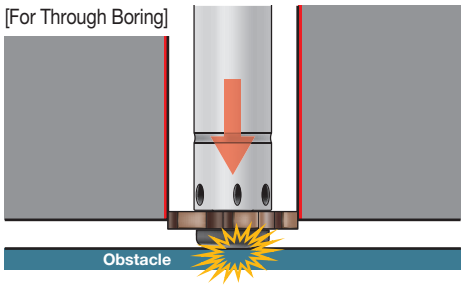
Failure	Countermeasures
Enlarged Diameter	· Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Decrease the cutting speed. · Increase the feed rate. · Increase the coolant concentration. · Reduce the stock removal. · Check the cutting edge for damage (whether there are built-up edges). · Change the reamer diameter.
Tapered Hole	· Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Decrease the cutting speed. · Decrease the feed rate. · Adjust the coolant concentration. · Review the pre-machining process. · Review the clamping method of the workpiece. · Compare the hole diameters when the workpiece is clamped and when it is unclamped. · Check and correct the direction of chip evacuation.
Chatter marks on machined surface 	· Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Change the approach angle of the insert cutting edge. · Review the clamping method of the workpiece. · Decrease the cutting speed. · Increase the feed rate.
Poor Surface Roughness	· Check the cutting edge for damage. · Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Check whether the cutting conditions are within the recommended range. · Change to internal coolant supply. · Increase the coolant concentration.

Failure	Countermeasures
Return Mark	· Reduce the runout as much as possible (use a holder with a diameter correction mechanism). · Check the cutting edge for damage (whether there are built-up edges). · Reduce the stock removal. · Change to an insert with a sharper cutting edge shape. · Decrease the return (lifting) feed.
Irregular Cutting Noise 	· Decrease the coolant concentration. · Increase the stock removal. · Check the cutting edge for damage. · Change the approach angle of the insert cutting edge.
Small Work Diameter	· Replace the insert. · Decrease the coolant concentration. · Increase the stock removal. · Increase the cutting speed. · Decrease the feed rate.

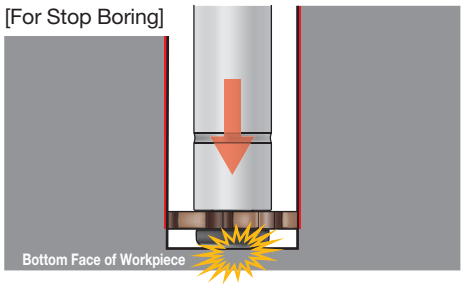
● Precautions for SD (Center Bolt Clamp)

This product can be used for both through-hole and stop-hole boring. However, the head of the center bolt protrudes from the end of the body, so ensure clearance by referring to the protrusion of the center bolt (LFA) shown in the dimension table.

[For Through Boring]



[For Stop Boring]



■ SR Reamer Usage Instructions (Adjusting Runout)

The runout at the cutting edge of a reamer should be zero to obtain optimum boring precision. To correct runout in the holder or the machine's spindle, use of holders with a runout adjustment mechanism, hydro chucks and shrink-fitting is recommended. Various methods can be used to measure runout on a SumiReamer SR Reamer. With good runout repeatability, it is recommended that inserts be replaced without removing the shank holder from the spindle.

- Runout Adjustment

Procedure:

1. Secure central clamping screw according to value "A" in the table (if no value is listed use value "B").
2. Load the tool into the machine spindle.
3. Set the indicator (with 1 µm / .0001 inch resolution on the marked run out ① area on the shank.
4. Measure run-out of the two adjustment screw ② axes.
   Compensate half the value of the total run-out error by using the adjustment screws. Check run out on all four axis points and repeat the adjustment if necessary. Tighten all adjusting screws, and verify run-out of .005 mm / .0002"" T.I.R. or less.
5. Tighten the central clamping screw according to the value in table "B".
6. Check the run out again and readjust if necessary.

For Reaming Diameters larger than *36.601 mm*

Procedure

1. Secure central clamping screw according to value "A" in the table (if no value is listed use value "B").
2. Load the tool into the machine spindle.
3. Set the indicator (with 1 µm / .0001 inch resolution) on the marked run out area ① on the shank.
4. Measure run-out of the two adjustment screw ② axes.

Compensate half the value of the total run-out error by using the adjustment screws. Check run out on all four axis points and repeat the adjustment if necessary. Tighten all adjusting screws, and verify run-out of .005 mm / .0002"" T.I.R. or less.

5. Tighten the central clamping screw according to the value in table "B".
6. Check the run out again and readjust if necessary.

Carbide Rod for Endmills, Drills & Reamers

Our Mission is to manufacture the highest quality tungsten carbide rod, by using the most modern production techniques available in the industry.

■ Features & Benefits

- All products manufactured in Japan
- Axismateria Ltd., subsidiary of Sumitomo Electric Hardmetal features two manufacturing facilities and a research & development location for carbide rod blanks.
- Only materials of highest quality are applied for production
- Incorporating the most advanced production facility available and unique manufacturing techniques, provides short delivery times and consistently high quality products
- We utilize the latest quality control and assurance systems
- We prioritize the advancement of high level research and development

■ Carbide Rod Grade Description

Class	Properties					Features	Products
	Grade	Grain Size (μm)	Cobalt Content (wt%)	TRS (GPa)	Hardness (HRA)		
Ultra- micro Grain	AF209	0.2	9.0	4.0	93.5	The finest micro-grain carbide	Ultra small size PCB Drills, drills, & endmills
	AF312	0.3	12.0	4.4	92.5	Very high toughness characteristics	Small size PCB drills
	AF310	0.3	10.0	4.1	93.0	High wear resistance with toughness	Small size PCB drills & routers
	AF308	0.3	8.0	3.8	93.6	High wear resistance ultra-micro grained	PCB drills & endmills for hardened steel
Micro Grain	AF513	0.5	13.0	4.2	91.4	Tough micro-grain carbide	Endmills, drills for fracture resistance & taps
	AF512	0.5	12.0	4.4	92.0	High wear resistance with added toughness	Endmills
	AF510	0.5	10.0	4.0	92.4	High wear resistance with added toughness	Endmills & drills for general purpose
	AF505	0.5	5.0	3.6	93.6	High wear resistance, micro-grain carbide	PCB drills & routers
Fine Grain	AF810	0.8	10.0	3.8	91.4	High wear resistance with added toughness	Endmills & drills
	AF806	0.8	6.0	3.5	93.0	High wear resistance at high speed machining	PCB drills
	AF805	0.8	5.0	3.3	93.2	High wear resistance, fine grain carbide	Endmills, drills for aluminum & reamers
	AF906	0.9	6.0	3.4	92.4	High toughness with average hardness	Endmills & drills for cast iron

Plate Blanks

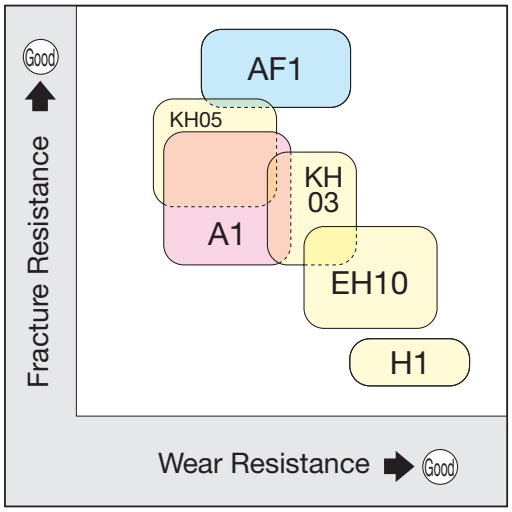
A comprehensive stocked range of grades in carbide plate blanks for mold and die materials, as well as carbide rods for drill or reamer materials.

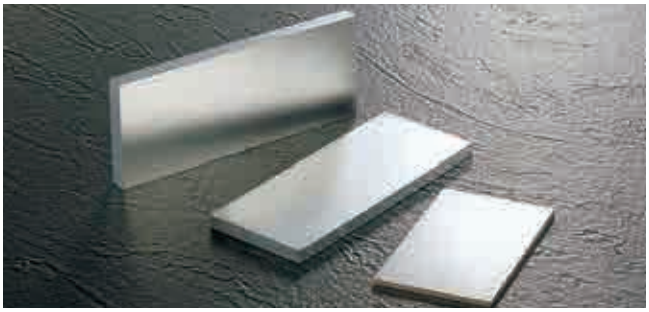
■ Grades

- **AF1 Ultra-fine grained Carbide**
  With grains finer than that of conventional grades, an excellent balance of high toughness and high hardness as well as superior edge sharpness is achieved.
- **A1 Micro-fine Grained Carbide**
  Micro-fine grained carbide A1 is a best-selling general purpose grade with high wear resistance and toughness.
- **Micro-grained Carbide H1**
  Reliable grade for machining non-ferrous metals.
- **Basic Carbide EH10**
  Highly evaluated grade for general machining of cast iron and exotic alloys. Perfect for drills and reamers.
- **KH Series**
  · KH03: Has strength (transverse rupture strength) and hardness similar to A1, with greatly improved chipping resistance that is comparable to ultra-fine grained grades.
  · KH05: With a higher cemented carbide binder content than KH03, this grade has even greater strength (transverse rupture strength) and chipping resistance.

■ Properties and Applications

Grade	Hardness		Transverse Rupture Strength	Applications	
	HRA	HV(GPa)	TRS(GPa)		
A1	91.4	15.6	3.2	Endmills	IT Mold Punches
AF1	92.5	17.3	4.4	Small Drills	
KH03	91.4	15.2	3.3	Molds / Dies	
KH05	90.4	13.6	3.5		
EH10	92.4	17.3	3.4	Drills, Reamers	
H1	92.9	17.7	2.1		





Ultra-fine grained carbide (AF1) is specially developed for the manufacturing of carbide mold parts (punches) with a variety of sizes in stock.

Rod Blanks

Rod Blanks grades ideal for applications such as endmills, drills and reamers where edge strength, toughness and wear resistance are essential.

- All Sintered surface
- Available Grades: AF312, AF513, AF805, AF906, AF308, AF510
- Special grades & 330 mm length available upon request

■ General Features

Sintered CBN - SUMIBORON®, which has CBN (cubic boron nitride) is a hard material second only to diamond - as its main component. CBN is sintered with a special ceramic binder under ultra-high pressure and temperature.
CBN - SUMIBORON® has high hardness, excellent thermal resistance and excellent properties including being unreactive to ferrous metals, enabling exotic alloys, hardened steel or hard cast iron to be machined. Excellent efficiency and longer tool life can also be achieved from high-speed finishing of cast iron.
Sumitomo's CBN - SUMIBORON® was first successfully developed in Japan by our company in 1977. Coated CBN - SUMIBORON® with a special ceramic coating, and binderless CBN made by directly bonding CBN particles without a binder are new additions to our product lineup.

■ Features

Sintered CBN - SUMIBORON® is mainly used for the machining of ferrous metals due to its low chemical reactivity with iron. There are 4 different classifications of CBN -SUMIBORON® as follows:

■ Classifications / Applications

	Classifications	Structure	Diagram	Grade	Work Material
(A)	With a high CBN content, where each grain is fused together, this group can be used for the machining of high-hardness materials like cast iron, heat-resistant alloys and sintered alloys.			BN7125 BN7000 BN700	K (FC) Sintered Alloy S
				BN7115	Sintered Alloy
				BN7500	Sintered Alloy
				BNS8125	K (FC/FCD) S
				BNC8115	K (FC/FCD) S H
(B)	CBN grains are held together by a special ceramic binder with a strong binding force provides excellent wear resistance and toughness in the machining of hardened steel and cast iron.			BN1000 BN2000 BN350 BNX10 BNX20	H
				BN500	K (FC/FCD)
(C)	SUMIBORON with special ceramic coating. The CBN and coating exhibit the hardness, toughness, thermal resistance and oxidation resistance that tool material requires for excellent cutting performance.			BNC2105 BNC2115 BNC2125 BNC2010 BNC2020 BNC300 BNC100 BNC160 BNC200	H
				BNC500	K (FCD)
(D)	Containing no binder but a structure of directly bonded nano- to sub-micron CBN particles which provides excellent hardness and thermal conductivity, making them highly efficient with long tool life when machining exotic alloys such as titanium alloys and cobalt-chrome alloys.			NCB100	K (FC) S Cemented Carbide Hard Brittle Material

Coated CBN Series

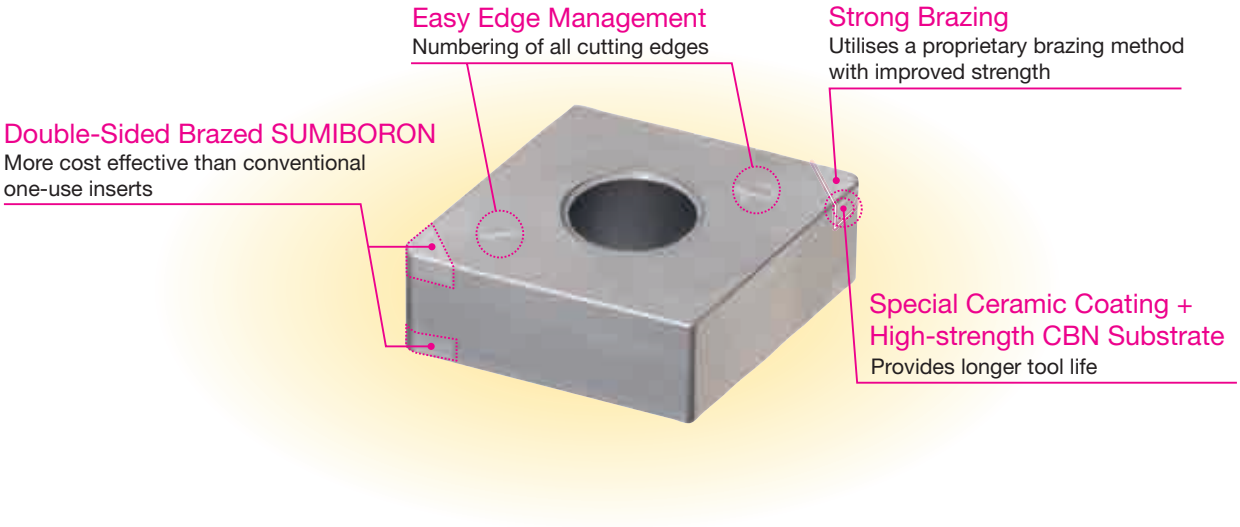
Achieves higher speed, higher efficiency and higher precision
Coated CBN (SUMIBORON)

■ General Features

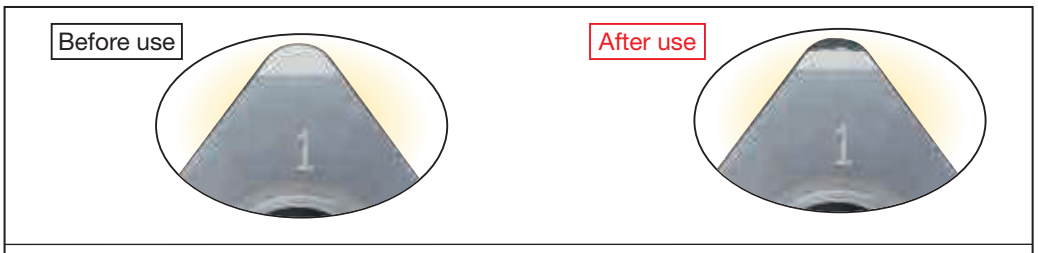
With a highly thermal-resistant and tough CBN substrate coupled with a special ceramic coating, this series caters to a wide variety of applications, with improved precision and longer tool life compared to conventional CBN.

Our extensive range, including more cost-effective, double-sided, multi-cornered one-use inserts, offers a selection of economical and easy-to-use tools.

■ Features



■ Cutting Edge Management



The edge numbers are still visible after machining, which makes the management of used cutting edges easy.

HARDENED STEEL MACHINING

● Advantages of CBN - SUMIBORON for hardened steel cutting

Below is an analysis of the use of CBN compared to grinding. In terms of cost, not only is the investment involved for introducing new machinery reduced, it is possible to shorten the processing cycle time by finishing complicated shapes in one run. In terms of quality, machining with a single chuck is possible, improving machining accuracy and squareness. Furthermore, dry machining is possible, with various advantages such as better global environmental conservation and resource recycling. The workpieces shown in the table to the lower right have shapes more likely to benefit from being cut, especially compared to grinding.

	Advantages	Remarks
Cost	Facility investment is low	· Cheaper machines · Reduced processes · Improved machining efficiency with less machining required
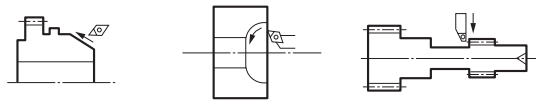
	Complex finishing in a single set-up	Quality	Improved precision	Environment	Environmentally-friendly	Sludge management → Chip control (Recyclable)

Machining Versatility with CBN



Taper Machining | Internal (Profile) Boring | Grooving / Profiling

Recommended Grade

	Grade	Binder	CBN Content (%)	Grain Size (μm)	Hardness HV (GPa)	TRS (GPa)	Main Coating Components	Coating Thickness (μm)	Features
Coated	BNC2105	TiCN	45 to 50	3	30 to 32	1.1 to 1.2	TiAlN Super Multi-Layered Coating	3	Grade with excellent wear resistant coating and a CBN substrate ideal for high-speed finishing applications.
Coated	BNC2115	TiN	60 to 65	3	31 to 33	1.3 to 1.4	TiAlSiN Super Multi-layered Coating	3	Utilizing a coating with exceptional notch wear resistance and a tough CBN substrate to achieve stable and excellent surface finish.
Coated	BNC2125	TiN	65 to 70	4	33 to 35	1.5 to 1.6	TiAlBN Super Multi-layered Coating	3	Combination of a tough CBN substrate and a coating that has a balance of wear resistance and toughness, to achieve even more stable machining.
Coated	BNC2010	TiCN	50 to 55	2	30 to 32	1.1 to 1.2	TiCN Multi-layered Coating	2	Improved wear resistance from coating and substrate, achieves excellent and consistent surface roughness.
Coated	BNC2020	TiN	70 to 75	5	34 to 36	1.4 to 1.5	TiAlN Multi-layered Coating	2	Utilising a tough substrate along with a highly wear-resistant and adhesive coating layer, to achieve long tool life in general-purpose to high-efficiency machining.
Coated	BNC300	TiN	60 to 65	1	33 to 35	1.5 to 1.6	TiAlN	1	Suitable for finishing work materials combining continuous and interrupted cutting.
Coated	BNC100	TiN	40 to 45	1	29 to 32	1.0 to 1.1	TiAlN/TiCN	3	Suitable for high-speed finishing thanks to highly wear-resistant coating.
Coated	BNC160	TiN	60 to 65	3	31 to 33	1.2 to 1.3	TiAlN/TiCN	3	Achieves stable, high-precision finishing of hardened steel.
Coated	BNC200	TiN	65 to 70	4	33 to 35	1.4 to 1.5	TiAlN	3	A tough CBN substrate and a coating with high wear resistance provide a long tool life.
Coated	BNC8115	Al Alloy	85 to 90	8	39 to 42	0.95 to 1.15	TiAlN	2	Grade with 100% solid CBN structure using PVD coating with excellent wear resistance to enable roughing operations.
Uncoated	BN1000	TiCN	40 to 45	1	27 to 31	0.9 to 1.0	-	-	Achieves ultimate wear and fracture resistance. Suitable for high-speed cutting.
Uncoated	BN2000	TiN	50 to 55	2	31 to 34	1.1 to 1.2	-	-	General-purpose grade for hardened steel machining with a high degree of fracture and wear resistance.
Uncoated	BNX20	TiN	55 to 60	3	31 to 33	1.0 to 1.1	-	-	Achieves excellent crater wear resistance. Suitable for high-efficiency cutting under high-temperature conditions.
Uncoated	BN350	TiN	60 to 65	1	33 to 35	1.5 to 1.6	-	-	Achieves ultimate cutting edge strength. Suitable for heavy interrupted cutting.
Uncoated	BNX10	TiCN	40 to 45	3	27 to 31	0.9 to 1.0	-	-	Excellent wear resistance. Suited for high-speed continuous machining.

Transverse rupture strength measured with test piece equivalent to insert CBN layer.

Recommended Range

Grade Guidance

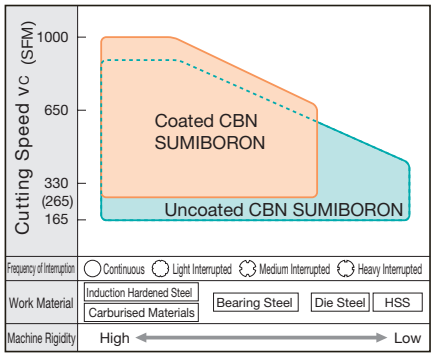
H Hardened Steel

Applications

Coated CBN - SUMIBORON: 1st recommendation for hardened steel machining, excellent performance in high-speed, high-efficiency machining.

Uncoated CBN - SUMIBORON: Optimal for machining small items with a limited cutting speed & hardened steel.

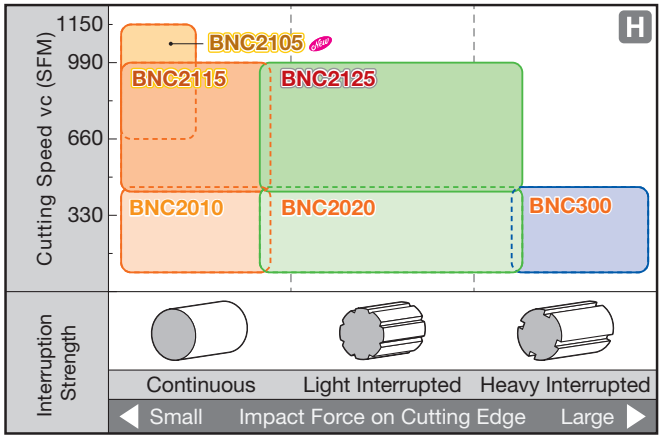
Series	Applications
Coated CBN SUMIBORON	· First recommendation for hardened steel machining · Machining requiring high speed and high accuracy · Machining requiring high efficiency, such as carburised layer removal
Uncoated CBN SUMIBORON	· Machining where cutting speed cannot be increased, such as small product machining · Machining of workpieces containing hard particles such as mold components · Machining with low tool rigidity



Application Range

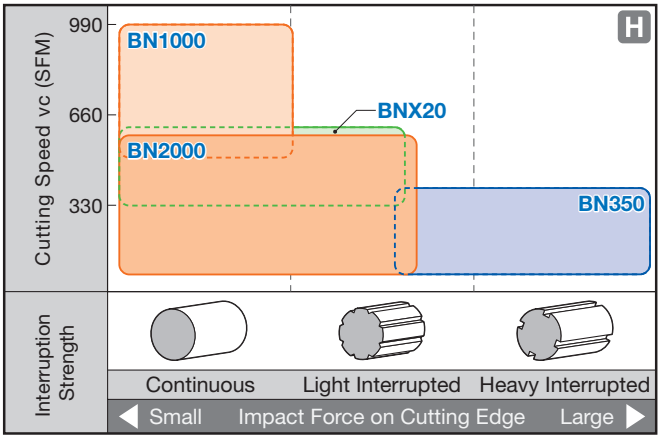
● Induction Hardened Steel (1045 Steel, 1050 Steel, etc.), Carburized Steel

Coated SUMIBORON



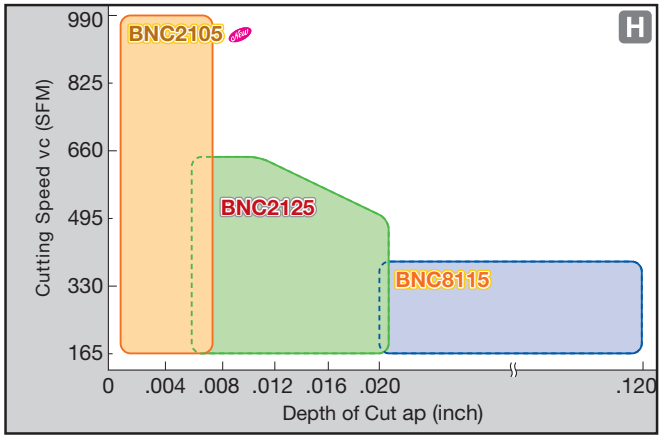
● Induction Hardened Steel (1045 Steel, 1050 Steel, etc.), Carburized Steel

Uncoated SUMIBORON



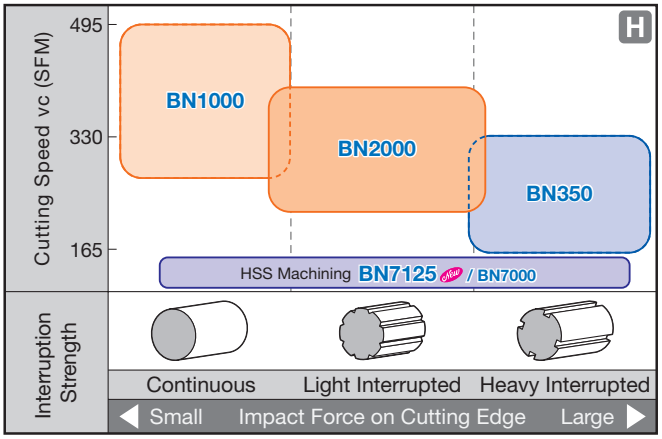
● Bearing Steel (SUJ2, etc.)

Coated SUMIBORON



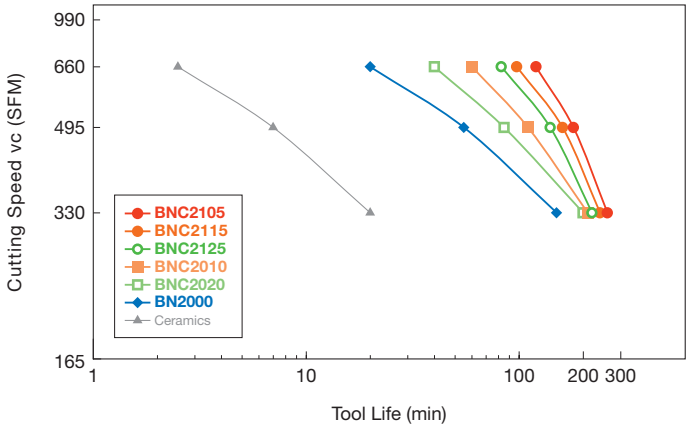
● Die Steel (SKD11/SKD61, etc.), HSS

Uncoated SUMIBORON



CBN Grade Guidance

Application Examples (Continuous Cutting)

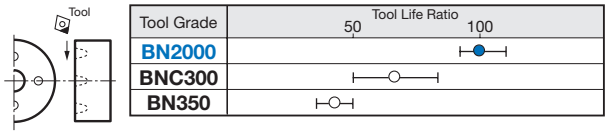


Tool Life Criterion: VBmax = .0039”

Part Material: Alloy Structural Steel Round Bar (58 to 62HRC)
Tool Cat. No.: DNGA432
Cutting Conditions: f = .0039 IPR, a_p = .0079" Wet

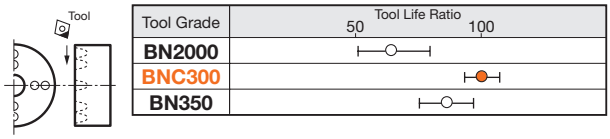
Application Examples (Interrupted Cutting)

[Light Int. - Face with 4 Chamfered Holes (Interrupted Cutting 25%)]



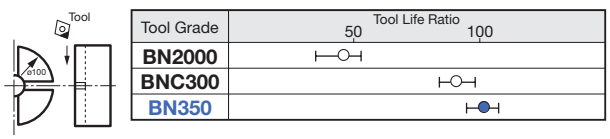
Part Material: Chromium Steel (58 to 62 HRC)
Tool Cat. No.: CNMA432
Cutting Conditions: v_c = 330 SFM, f = .0039 IPR, a_p = .0079" Dry

[Medium Int. - Face with 8 Chamfered Holes (Interrupted Cutting 50%)]



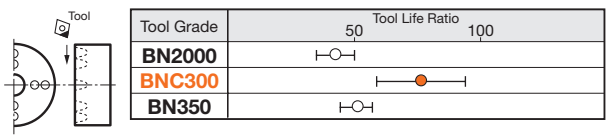
Part Material: Chromium Steel (58 to 62 HRC)
Tool Cat. No.: CNMA432
Cutting Conditions: v_c = 330 SFM, f = .0039 IPR, a_p = .0079" Dry

[Heavy Int. - U Groove Face (Interrupted Cutting 100%)]



Part Material: Chromium Steel (58 to 62 HRC)
Tool Cat. No.: CNMA432
Cutting Conditions: v_c = 330 SFM, f = .0039 IPR, a_p = .0079" Dry

[High Speed Int. - Face with 8 Chamfered Holes (Interrupted Cutting 50%)]



Part Material: Chromium Steel (58 to 62 HRC)
Tool Cat. No.: CNMA432
Cutting Conditions: v_c = 650 SFM, f = .0039 IPR, a_p = .0079" Dry

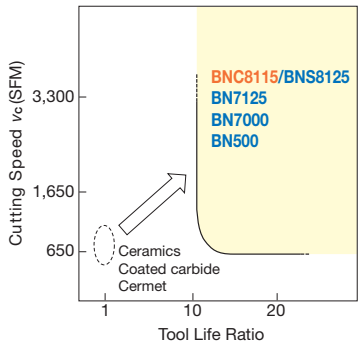
CAST IRON MACHINING

- Advantages of machining cast iron with CBN - SUMIBORON

Compared with conventional tools, a longer tool life for high speed machining is acheived. In addition, machining efficiency is improved along with consistently better wear resistance, a sharper edge, excellent surface roughness and dimensional tolerance. CBN - SUMIBORON is ideal for finishing of gray cast iron and ductile cast iron and heat-treated high-grade cast iron such as ADI.

High-speed Machining

- Gray Cast Iron



High-speed Machining

SINTERED COMPONENT MACHINING

- Advantages of cutting sintered components with CBN - SUMIBORON

CBN - SUMIBORON has much smaller edge wear than carbide or cermet, and also has better wear resistance and can form a sharp edge easily. CBN - SUMIBORON is able to prevent burrs and chipping on the edges of the workpiece, achieving good machining precision and surface roughness.

Sintered Components

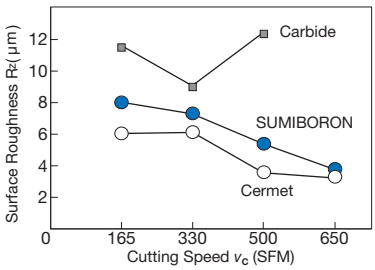
Recommended Grade

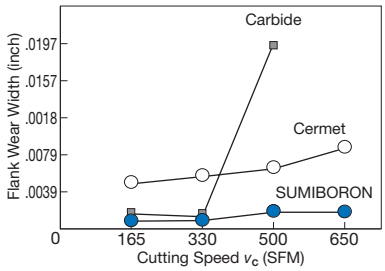
Grade	Binder	CBN Content (%)	Grain Size (μm)	Hardness HV (GPa)	TRS (GPa)	Main Coating Components	Coating Thickness (μm)	Features
BN7115	Co Compound	90 to 95	1	41 to 44	2.2 to 2.3	-	-	Grade balancing ultimate cutting edge sharpness with fracture resistance, suitable for finishing of sintered alloy.
BN7500	Co Compound	90 to 95	1	41 to 44	2.0 to 2.1	-	-	Grade maintaining good cutting edge sharpness, suitable for finishing of sintered alloy.
BN7125	Co Compound	90 to 95	2	41 to 44	1.9 to 2.0	-	-	Grade balancing ultimate fracture resistance with wear resistance, suitable for roughing of sintered alloy.
BN7000	Co Compound	90 to 95	2	41 to 44	1.8 to 1.9	-	-	Grade exhibiting improved wear and fracture resistance in roughing of sintered alloy.

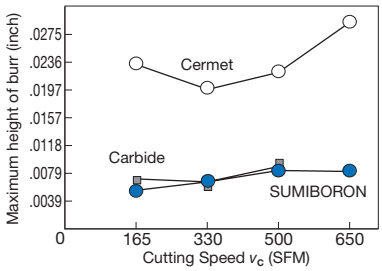
Transverse rupture strength measured with test piece equivalent to insert CBN layer

Performance

- Grade Performance Comparison







Work Material: SMF4040 equivalent
Machining Details: ø80-ø100 heavy interrupted facing with grooves and drilled holes (after 40 passes)
Tool Cat. No.: TNGA331
Cutting Conditions: f = .0039 IPR, a_p = .0039" Wet

For general powdered metal, carbide and cermet grades can perform up to v_c = 330 SFM. However, around v_c =400 SFM, wear becomes rapid and surface roughness deteriorates with increased burrs. On the other hand, CBN (SUMIBORON) exhibits stability and superior wear resistance, burr prevention and surface roughness, especially at high speeds.

Valve Seat Ring (VSR)

*VSR has both (Intake: IN) and (Exhaust: EX) with the exhaust generally being hardened.

Recommended Grade

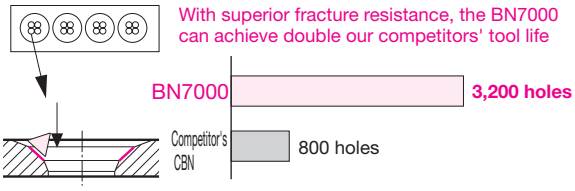
- Recommended Grade by Machining Details

	Gasoline VSR material	Diesel VSR material
Plunge cut	BN7000 BN7500 / BN350	BN7000 BN7500 / BN350
Traverse cut	BN7000 BN7500 / BN500	BN7000 BN7500 / BN500
Workpiece Hardness (HV)	Low ← 300HV → High	Low ← 300HV → High

Recommended Cutting Conditions

Cutting Speed v_c(SFM)	Feed Rate f (IPR)	Depth of Cut a_p(inch)
165 to 415	.0012 to .0079	.0020 to .0197

Application Examples



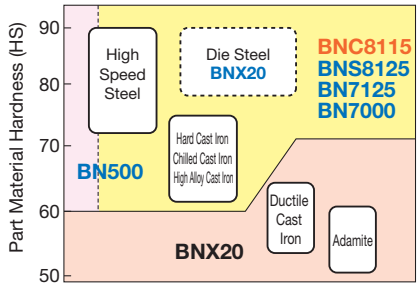
Part Material: Powdered Metal (150 to 250 HV)
Machining Details: VSR(IN) 45° Surface Finishing
Tool Cat. No.: TBGN521B
Cutting Conditions: v_c=330 SFM, f = .0031 IPR Wet

ROLL MACHINING

- Advantages of roll machining with CBN - SUMIBORON

CBN - SUMIBORON enables the machining of high-hardness rolls that were previously difficult to machine with conventional tools, drastically improving machining efficiency.

Recommended Grade



Finishing to Medium to Roughing
Roll stand (example for bar steel rolling)

Recommended Cutting Conditions

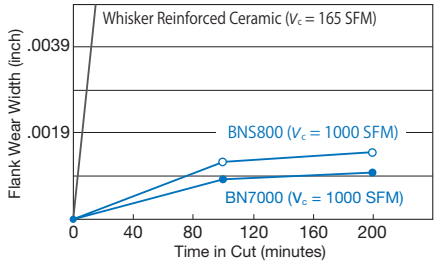
Part Material		Recommended Cutting Conditions		
Category	Hardness (HS)	Cutting Speed v_c (SFM) 65 130 200 265 330 400 465	Feed Rate f (IPR)	Depth of Cut a_p (Inch)
Adamite	≥ 40		.0039 - .0197	.0079 - .1181
Chilled cast iron	≥ 60		.0039 - .0197	.0079 - .1181
High-alloy cast iron	≥ 60		.0039 - .0197	.0079 - .1181
HSS	≥ 70		.0039 - .0157	.0039 - .1181

HARD FACING ALLOY MACHINING

- Advantages of hard facing alloy machining with CBN - SUMIBORON

CBN - SUMIBORON enables the machining of high-hardness facing alloys that were previously difficult to machine with conventional tools, drastically improving machining efficiency. The first recommended grade is BN7000, followed by BNS800.

Performance



Work Material: Colmonoy No.6 (NiCr-Based Self-Fluxing Alloy)
Tool Cat. No.: SNG322
Cutting Conditions: f = 0.0039 IPR, a_p = .0079" Dry

- BN7000 has a long tool life and minimal wear with high speed cutting

Recommended Cutting Conditions

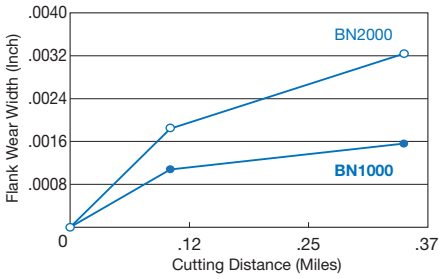
Part Material		Recommended Cutting Conditions		
Category	Material	Cutting Speed v_c (SFM) 165 330 660 1000	Feed Rate f (IPR)	Depth of Cut a_p (inch)
Ni-Based Self-Fluxing Alloy	Colmonoy No.6		.0019 - .0079	.0039 - .1181
Co-Based Self-Fluxing Alloy	Stellite		.0019 - .0079	.0039 - .0394

Hardened Stainless Steel Machining

- Advantages of machining hardened stainless steel with SUMIBORON

SUMIBORON enables the machining of hardened stainless steel, previously difficult to machine with conventional tools, drastically improving machining efficiency.
The first recommended grade is BN1000. When strength is required, we recommend BN2000.

Cutting Performance



Work Material : SUS440C (59 to 61HRC, continuous)
Tool Cat. No. : 2NU-CNGA120408
Cutting Conditions: vc = 660 SFM, f = .004 IPR, ap = .004", Wet

Recommended Cutting Conditions

Work Material	Recommended Cutting Conditions		
Category	Cutting Speed vc (SFM) 165 330 660 990	Feed Rate f (IPR)	Depth of Cut ap (Inch)
Hardened Stainless Steel		.001 to .008	.001 to .012

TITANIUM ALLOY CUTTING

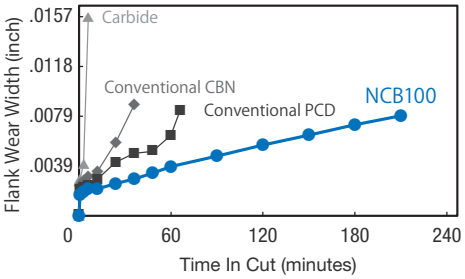
- Advantages of titanium alloy machining with SUMIBORON
  CBN (SUMIBORON) enables high speed machining of titanium alloys that were previously difficult to machine with conventional tools, drastically improving machining efficiency.

Recommended Grade

Grade	Binder	CBN Content (%)	Grain Size (μm)	Hardness HV (GPa)	Transverse Rupture Strength (GPa)	Main Coating Components	Coating Thickness (μm)	Features
NCB100	—	100	0.2 to 0.5	51 to 54	1.8 to 1.9	—	—	Ideal for high-efficiency finishing of titanium alloy.

Transverse rupture strength measured with test piece equivalent to insert CBN layer

Performance



Work Material: Titanium Alloy (Ti-6Al-4V)
Tool Cat. No.: CNGA432
Cutting Conditions: V_c = 500 SFM, f = 0.0059 IPR, a_p = .0197"
Wet (High Pressure Coolant)

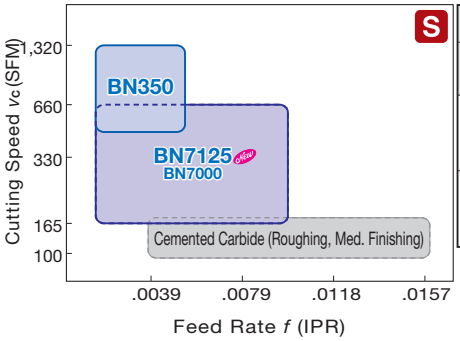
Recommended Cutting Conditions

Part Material		Grade	Recommended Cutting Conditions Min. - Max.		
Composition	Hardness (HRC)		Cutting Speed v_c (SFM) 165 330 500 660 825 1000	Feed Rate f (IPR)	Depth of Cut a_p (inch)
Ti-6Al-4V	30 - 35	NCB100		.0039 - .0197	.0039 - .0197
Ti-5Al-5V-5Mo-3Cr	32 - 38	NCB100		.0039 - .0197	.0039 - .0197
Ti-10V-2Fe-3Al	32 - 38	NCB100		.0039 - .0197	.0039 - .0197

HEAT-RESISTANT ALLOY MACHINING

- Advantages of heat-resistant alloy machining with CBN - SUMIBORON
  CBN - SUMIBORON provides long tool life in the finishing of heat-resistant alloys.

Recommended Grade



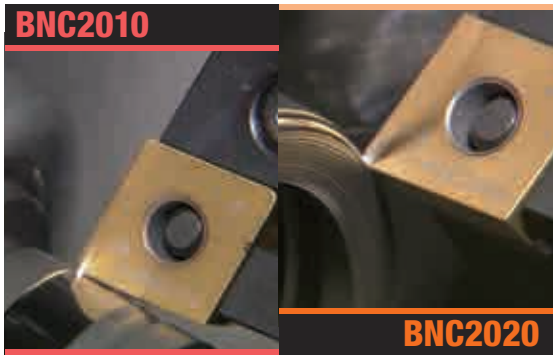
Recommended Cutting Conditions

Part Material		Recommended Cutting Conditions		
Category	Material	Cutting Speed v_c (SFM) 165 330 500 660	Feed Rate f (IPR)	Depth of Cut a_p (Inch)
Ni-Based Heat-Resistant Alloy	Inconel 718		.0019 - .0079	.0039 - .0394
Co-Based Heat-Resistant Alloy	Stellite		.0019 - .0079	.0039 - .0394

- CBN - SUMIBORON is ideal for finishing heat-resistant alloys.

BNC2115 / BNC2125 / BNC2010 / BNC2020

H Hardened Steel



Longer Tool Life and Cost Reduction

■ General Features

Provides improved machining accuracy and longer tool life compared to conventional Coated CBN - SUMIBORON by combining newly developed CBN substrate and ceramic coating.
Exhibits excellent performance in high-precision and general cutting of hardened steel and enables reductions in machining costs.

■ Lineup

● BNC2115 · The ultimate in high-precision machining of hardened steel
Utilizing a thick coating with exceptional notch wear resistance and a tough CBN substrate to achieve stable and excellent surface finish.

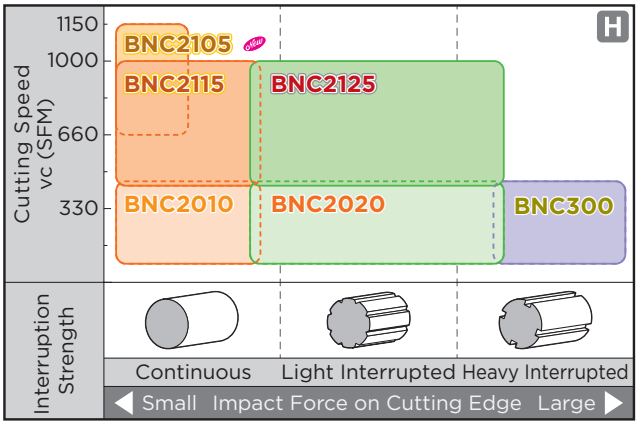
● BNC2125 · First recommendation for hardened steel machining
Combination of a tough CBN substrate and a thick coating that has a balance of wear resistance and toughness, to achieve stable machining in a wide range of applications.

● BNC2010 · High-precision grade for low- to medium-speed machining
Excellent wear resistant CBN substrate and coating layer, for high-precision machining that requires surface roughness and surface finish accuracy.

● BNC2020 · General-purpose grade for low- to medium-speed machining
Utilizing an especially high wear resistant coating and a tough CBN substrate. Excellent machining stability in low-rigidity situations and high-load cutting

■ Application Range

● Induction Hardened Steel (1045/1050, etc.), Carburised Steel



■ Differentiation

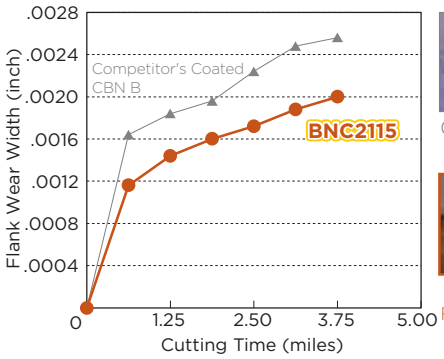
BNC2115 Continuous Cutting (Wear Resistance)

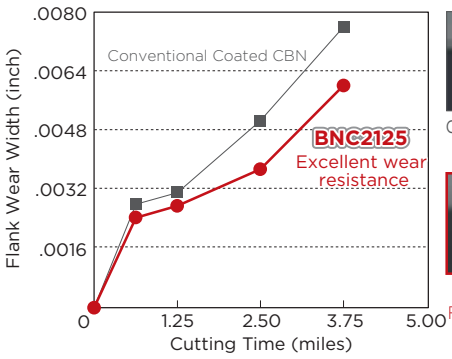


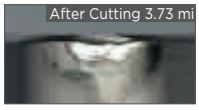
Competitor's Coated CBN B

BNC2115
Flank Wear Suppressed

Work Material: SCM415H (58-62HRC)
Tool Cat. No.: 4NC-DNGA432
Cutting Conditions: vc = 660 SFM, f = .0039 IPR, ap = .0197" Wet

BNC2125 Continuous Cutting (Wear Resistance)





Conventional Coated CBN
Flank Wear Progresses

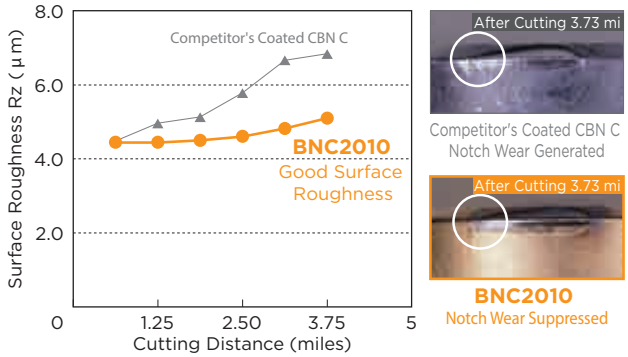
BNC2125
Flank Wear Suppressed

Work Material: 52100 (58-62HRC)
Tool Cat. No.: 4NC-DNGA432
Cutting Conditions: vc = 500 SFM, f = .0039 IPR, ap = .0079" Wet

BNC2115 / BNC2125 / BNC2010 / BNC2020

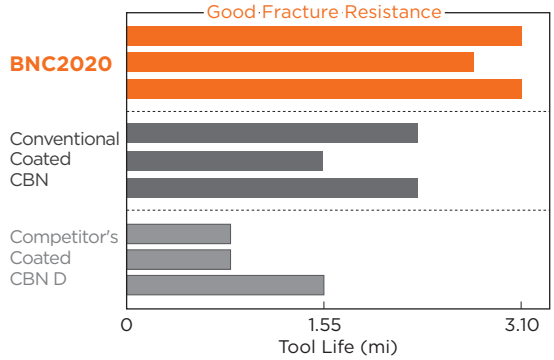
■ Cutting Performance

BNC2010 Continuous Cutting (Machined Surface Roughness)



Work Material: SCM415H (58-62HRC)
Tool Cat. No.: 4NC-DNGA432
Cutting Conditions: vc = 400 SFM, f = .0055 IPR, ap = .0059" Wet

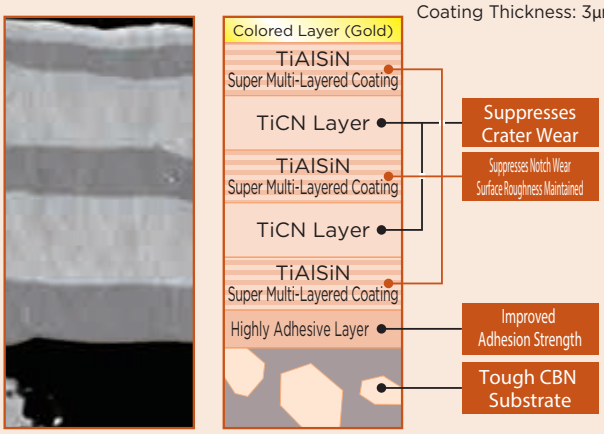
BNC2020 Interrupted Cutting (Fracture Resistance)



Work Material: SCM415H with 5 grooves (58 to 62HRC)
Tool Cat. No.: 4NC-CNGA433
Cutting Conditions: vc = 425 SFM, f = .0039 IPR, ap = .0236" Dry

BNC2115 High-precision Machining (Medium- to High-speed)

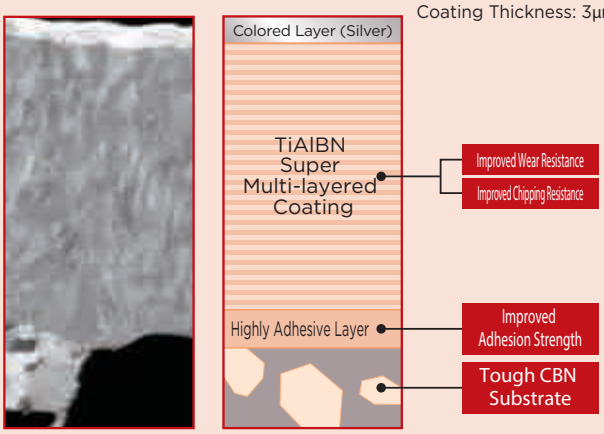
Coating Thickness: 3μm



Thick layers of high-strength TiAlSiN super multi-layered coating and highly heat-resistant TiCN coating are applied to a tough substrate to provide excellent surface finish quality

BNC2125 General-purpose Machining (Medium- to High-speed)

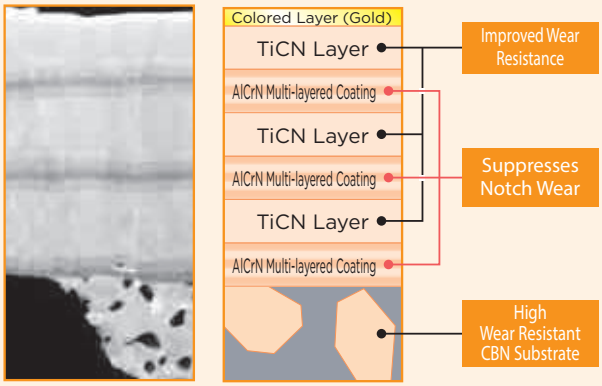
Coating Thickness: 3μm



Thick layer of super multi-layered ultra-fine TiAlBN coating with high strength and high hardness coupled with a tough substrate achieves high performance in a wide range of applications

BNC2010 High-precision Machining (Low- to Medium-speed)

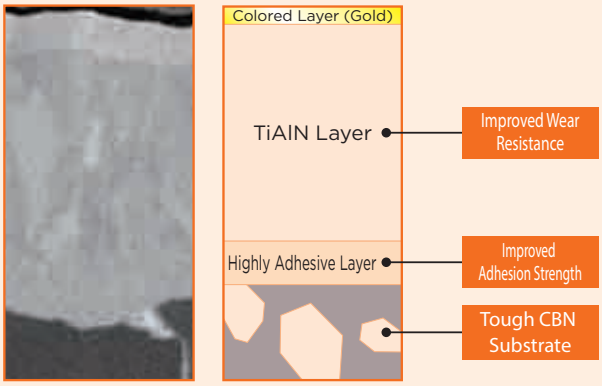
Coating Thickness: 2μm



Stacked high-strength AlCrN multi-layered coating and highly heat-resistant TiCN coating are applied to a highly wear-resistant substrate to maintain excellent surface finish quality

BNC2020 General-purpose Machining (Low- to Medium-speed, Unstable Cutting)

Coating Thickness: 2μm



Application of highly wear-resistant TiAlN coating to a tough substrate dramatically improves machining stability in low-rigidity setups and high-load cutting

The Definitive Grade in High-Speed, High-Accuracy Machining

■ General Features

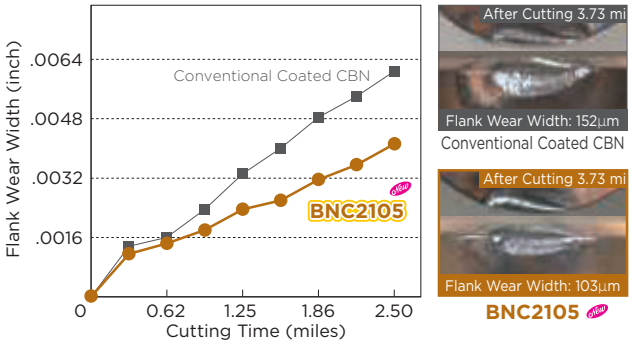
BNC2105 is the latest addition to the BNC lineup, fulfilling even higher-speed machining with Coated CBN, our first recommendation for high-speed machining of hardened steel.

● BNC2105 New

· Fulfills outstanding wear resistance in high-speed machining of hardened steel
Excellent wear resistant coating and CBN substrate, achieve stable and long tool life in high-speed machining.

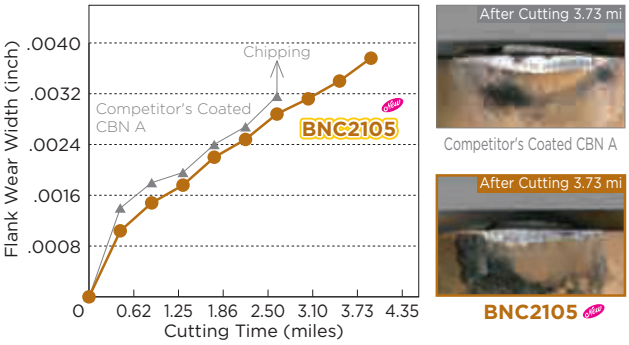
■ Cutting Performance

BNC2105 New Continuous Cutting (Wear Resistance)



Work Material: 52100 (58-62HRC)
Tool Cat. No.: 4NC-DNGA432
Cutting Conditions: vc = 660 SFM, f = 0.0039 IPR, ap = .0039" Wet

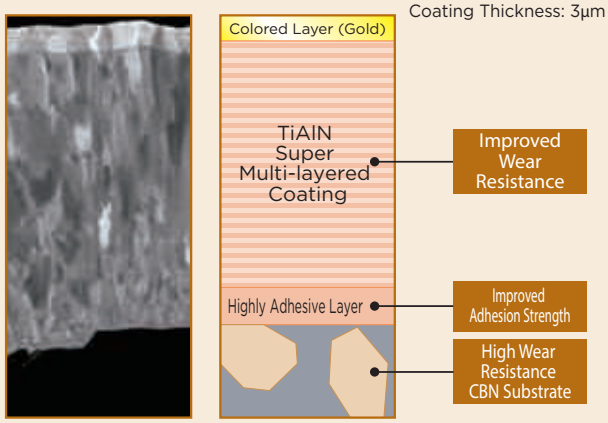
BNC2105 New Continuous Cutting (Wear Resistance)



Work Material: SCM415H (58-62HRC)
Tool Cat. No.: 4NC-DNGA432
Cutting Conditions: vc = 820 SFM, f = .0024 IPR, ap = .0039" Wet

■ CBN Substrate and Coating Structure

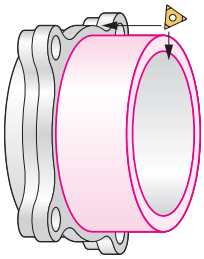
BNC2105 New High-precision Machining (High-speed)

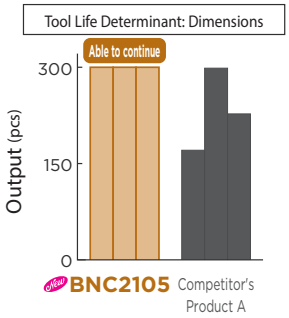


Highly wear-resistant TiAlN super multi-layered coating is made thicker. Utilizes long tool life in high-speed cutting in combination with a substrate using a newly developed TiCN binder with excellent thermal resistance

52100 Bearing Steel Hub (60HRC) H

BNC2105 suppresses fractures due to crater wear and realizes stable machining





Tool: 6NC-TNGA332 (BNC2105)
Cutting Conditions: vc = 750 SFM, f = .0047 IPR,
ap = .004" Wet

The Ultimate in Interrupted Cutting of Hardened Steel

■ General Features

BNC300

A CBN substrate that emphasizes toughness is coupled with a highly wear-resistant TiAlN-based coating layer that has improved adhesion strength. With a good balance of fracture and wear resistance, this grade achieves a long, stable tool life in interrupted cutting or in a mixture of continuous and interrupted cutting.

BN350

CBN - SUMIBORON with the highest fracture resistance and toughest CBN. Reliable grade for achieving stable tool life in heavy interrupted cutting conditions.

■ Features

•BNC300

· Long, stable tool life in interrupted cutting
Achieving long, stable tool life in heavy interrupted cutting, with superior fracture resistance.

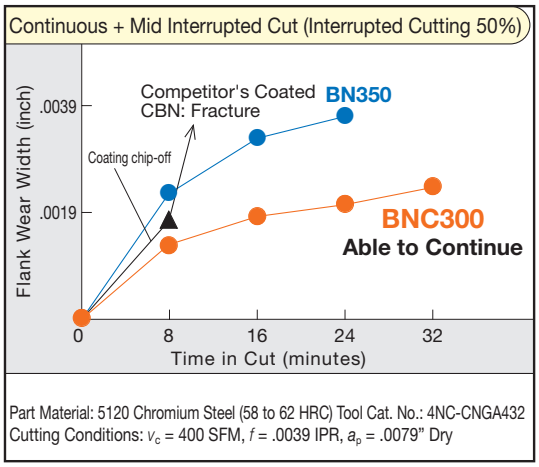
· Superior dimensional tolerance
TiAlN-based high-wear-resistance coating with good adhesion strength. Achieves superior dimensional tolerance even in interrupted cutting.

· Supports various work material shapes
Achieves long, stable tool life even in workpieces requiring both continuous and interrupted cutting.

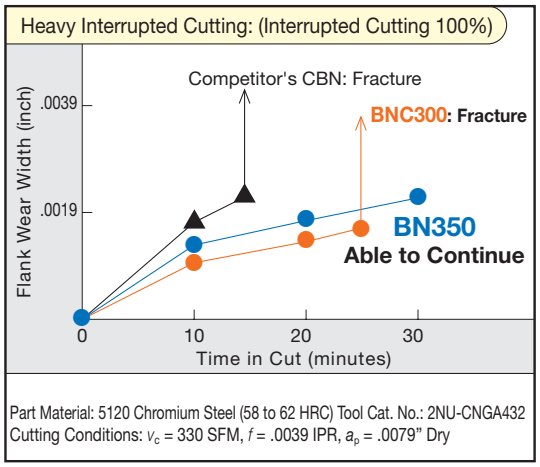
•BN350

· Superb stability with regard to fracture
Superior fracture resistance, preventing the fractures that commonly occur during interrupted cutting. Achieves a long, stable tool life.

■ Cutting Performance



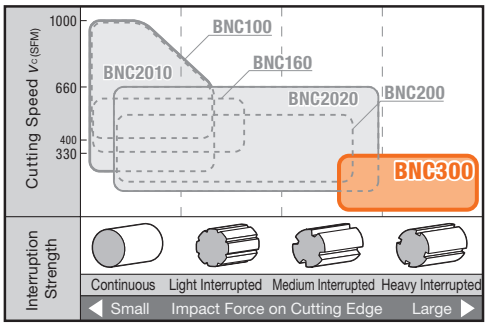
• **BNC300** has a superior balance of fracture and wear resistance.



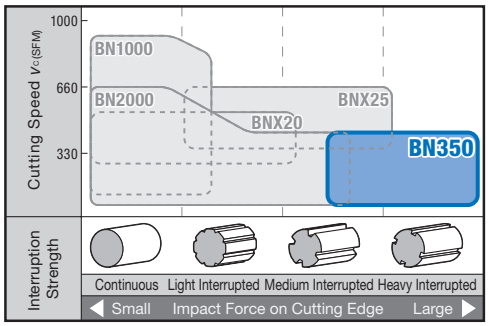
• **BN350** exhibits very good fracture resistance.

■ Application Range

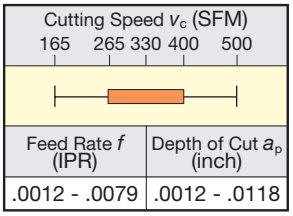
• Coated CBN (SUMIBORON)



• CBN (SUMIBORON)

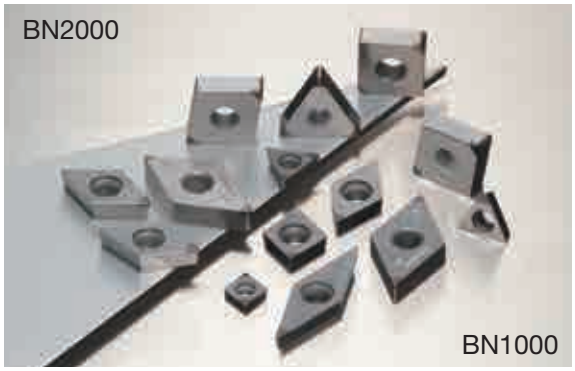


■ Recommended Cutting Conditions (BNC300/BN350 common)



Coolant: Dry

BN1000 / BN2000



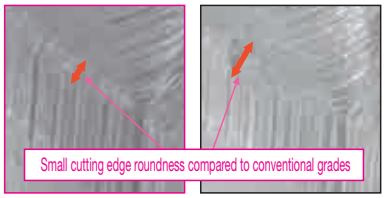
■ General Features

Uncoated CBN - SUMIBORON grades that have a newly developed high-purity ceramic binder applied to them. Both fracture and wear resistance are combined to achieve a stable tool life in a wide variety of hardened steel machining.
We offer a wide selection of tools starting with single-cornered types.

■ Features

- **BN1000**
  - **CBN - SUMIBORON grade for high-speed machining with the best wear resistance,** providing superior tool life in continuous cutting to light interrupted cutting.
  - **Improved fracture resistance while also emphasizing wear resistance**
    Improved hardness and thermal resistance from the high-purity TiCN ceramic binder.
- **BN2000**
  - **General-purpose grade suitable for typical hardened steel machining applications**
    Provides stable tool life in everything from continuous cutting to light to medium interrupted cutting.
  - **Has a high degree of both fracture and wear resistance**
    Significant improvements in the performance of both by employing a high-purity ceramic binder.
  - **Stable surface roughness achieved by increasing edge sharpness (right figure)**

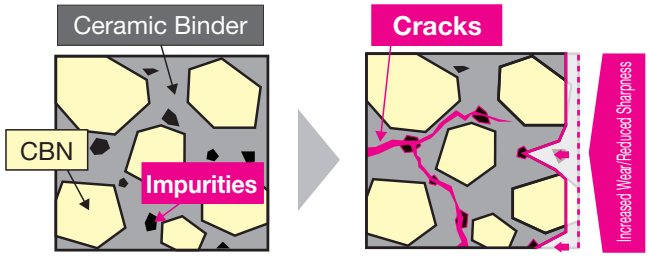
Sharpness Comparison



BN2000 | Conventional Grade

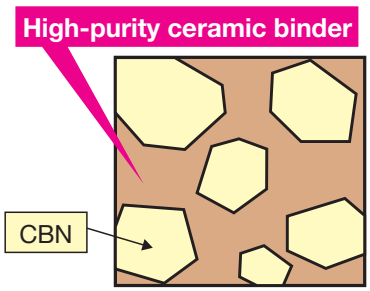
■ Newly Developed High-Purity Ceramic Binder

Conventional Grade



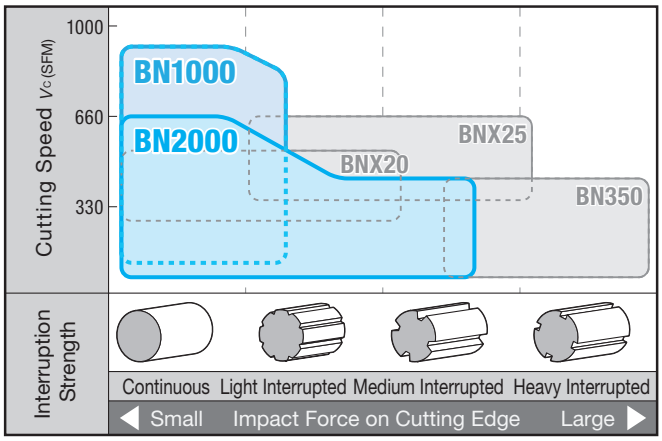
The impurities contained in the ceramic binder for conventional grades decrease the sintered body strength and thermal resistance, leading to cracks (breakage) and wear.

BN1000 / BN2000



With a newly developed high-purity ceramic binder, BN1000 / BN2000 achieve toughness and improved thermal resistance by decreasing impurities to an extreme.

■ Application Range



■ Recommended Cutting Conditions

- BN1000

Cutting Speed v_c (SFM)	
Feed Rate f (IPR)	Depth of Cut a_p (inch)
.0012 - .0059	.0012 - .0079

● BN2000

Work Material: Chromium Molybdenum Steel Round Bar (58 to 62HRC)
Tool Cat. No.: 2NU-CNGA432
Cutting Conditions: v_c = 330 SFM, f = .0031 IPR, a_p = .0079" Dry

BN7125 K Cast Iron Sintered Alloy /BN7115 Sintered Alloy

New

■ Features

Improved wear resistance through high CBN content. Further, with improved CBN particle/binder boundary strength due to the special binder and improved binding strength between CBN particles thanks to our proprietary sintering process, excellent fracture resistance is achieved.
Provides stable performance for high-speed finishing of cast iron, sintered alloy and exotic alloys.

■ Lineup

● BN7125 New

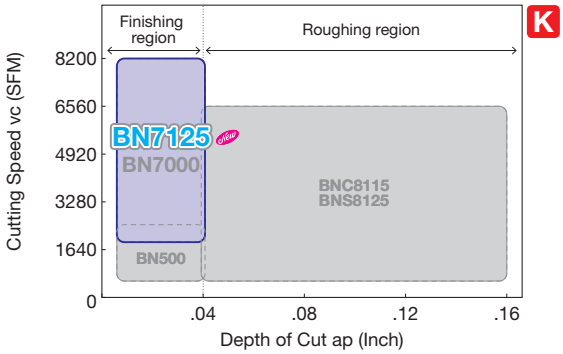
General-purpose Grade for Cast Iron/Sintered Alloy Machining
Achieves high-efficiency machining of sintered alloy with a standard + 3 types of cutting edge variations
Exhibits good thermal crack resistance in high-speed machining of cast iron
Also supports machining of difficult-to-cut materials such as rolls, high speed steel and heat-resistant alloys

● BN7115

Edge sharpness in sintered alloy machining is excellent, suppressing burrs and tearing

■ Application Range

● Cast Iron



● Sintered Alloy

BNC8115 / BNS8125

K Cast Iron H Hardened Steel

■ Features

Covers a wide range of machining applications from roughing to finishing of cast iron, hard-to-cut cast iron and hardened steel.
100% solid CBN structure enables depth-of-cut of .20" and above.

■ Lineup

● BNC8115

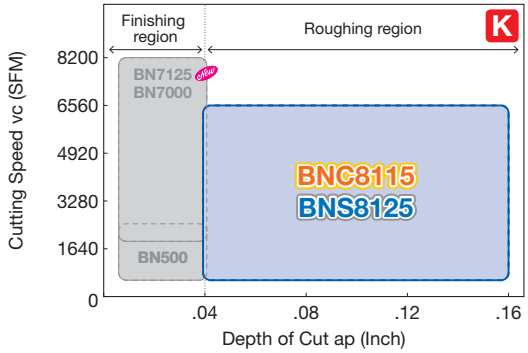
PVD coating with excellent wear resistance suppresses flank wear when machining difficult-to-cut cast iron and hardened steel. Ideal for roughing and depth-of-cut of .020" - .118". Can also be used for roughing and finishing of gray cast iron. Gold coating improves visibility of used corners.

● BNS8125

Optimizing the particle size distribution of the CBN particles has resulted in improved fracture resistance and longer life while maintaining wear resistance during gray cast iron machining.

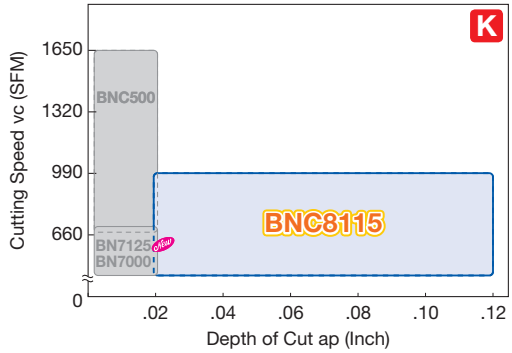
■ Application Range

● Gray Cast Iron

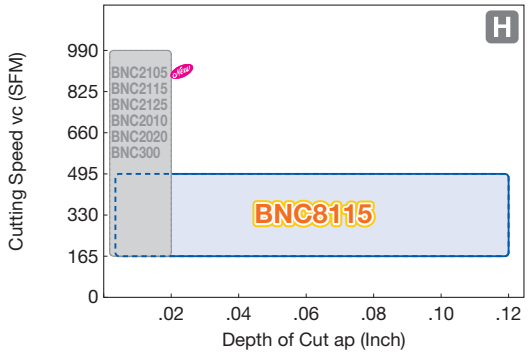


Wet machining is recommended for gray cast iron
For dry machining, BNC8115/BNS8125 are recommended for both roughing and finishing

● Ductile Cast Iron



● Hardened Steel



■ Recommended Cutting Conditions

● Cast Iron (Turning) K

Work Material	Grade	Recommended Cutting Conditions Min. - **Optimum** - Max.

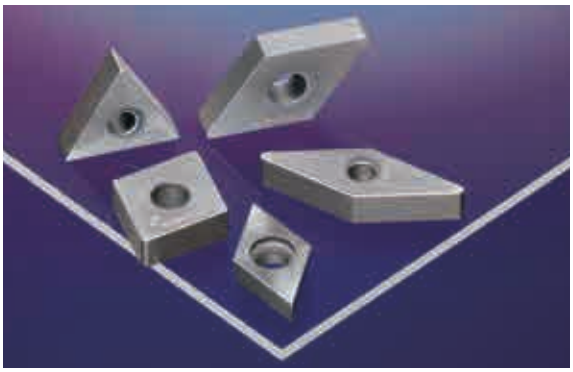
○: Recommendation

Coated CBN grades for ductile cast iron machining

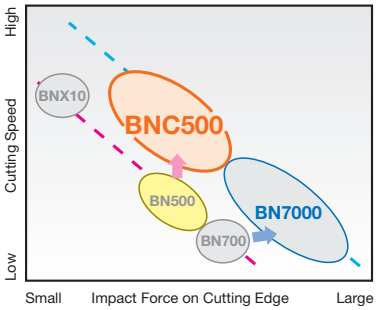


■ General Features

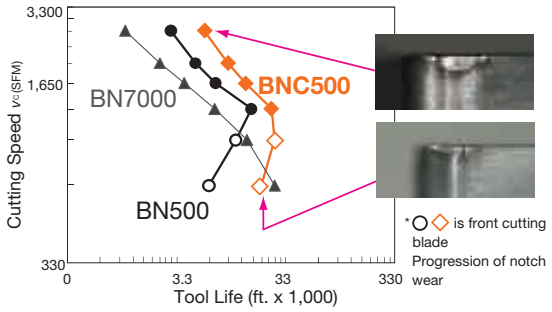
Broad improvements in the toughness of the CBN substrate and wear resistance through the use of a newly developed high-purity TiC binder. In addition, it demonstrates exceptional wear resistance by combining a ceramic coating with excellent thermal resistance. High-speed, high-precision machining is achieved when finishing ductile cast iron. It also provides a long, stable tool life for machining high-strength ductile cast iron, special cast irons such as vermicular cast iron and centrifugally-cast cast iron.

■ Features

● Stable tool life for high-speed machining of ductile cast iron
Superior wear resistance, making stable machining possible under high-speed conditions. Supports high-precision machining. Can maintain excellent dimensional tolerance and surface roughness over many hours.

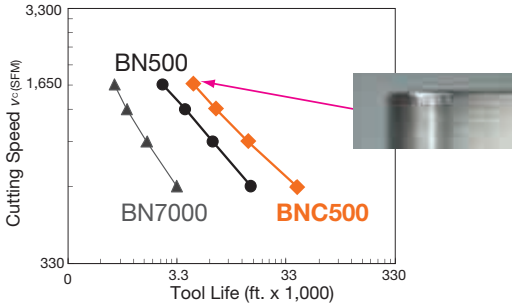


● Cast Iron Continuous Cutting (V-T Chart)



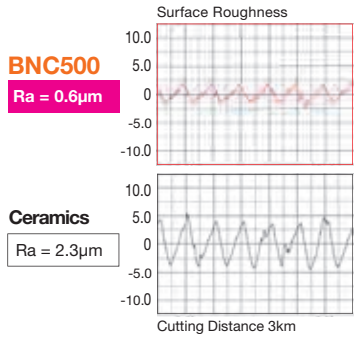
Part Material: Ductile Cast Iron (160HB) Tool Cat. No.: 4NC-CNGA432
Cutting Conditions: f = .0079 IPR, a_p = .0079" Wet
Tool Life Criterion: $V_B$max. = .0079"

● Ductile Cast Iron Continuous Cutting (V-T Chart)



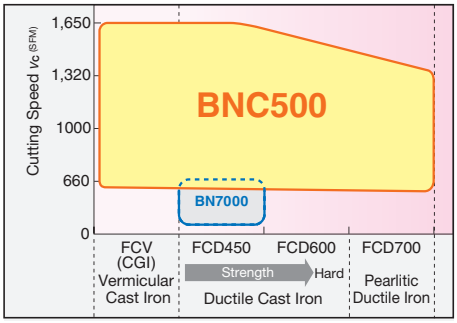
Part Material: 100-70-03 Cast Iron (260HB) Tool Cat. No.: 4NC-CNGA432
Cutting Conditions: f = .0079 IPR, a_p = .0079" Wet
Tool Life Criterion: $V_B$max. = .0079"

■ Machined Surface Quality

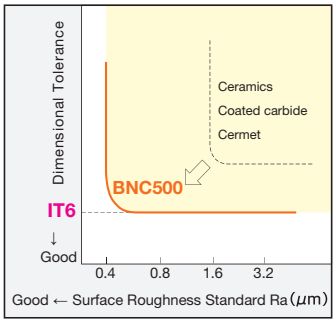


Part Material: Ductile Cast Iron FCD700 (260HB)
Cutting Conditions: V_C=1,320 SFM, f =.0039 IPR
a_p=.0039" Wet

■ Application Range



■ High-Precision Machining



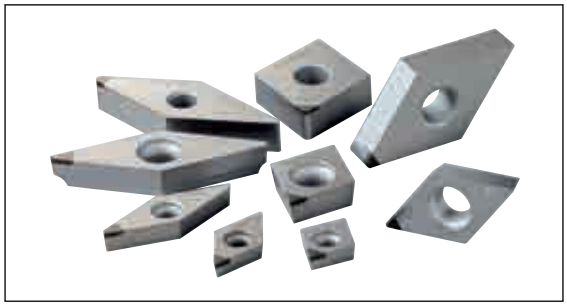
■ Recommended Cutting Conditions

Cutting Speed V_c (SFM) 660 – 1,000 – 1,320 – 1,650	
Feed Rate f (IPR)	Depth of Cut a_p (inch)
.0039 to .0157	≤ .0197

Cutting Oil: Wet

Nano-Polycrystalline CBN

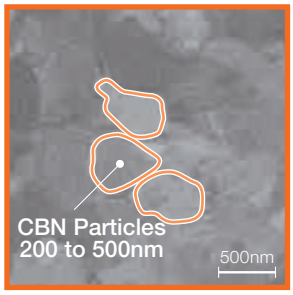
New



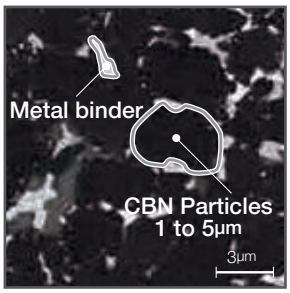
■ General Features

Binderless CBN, which does not contain any binders, is a CBN sintered product with directly and strongly bonded nano- to sub-micron CBN particles.
Compared to conventional CBN grades, this provides high hardness and thermal conductivity, making it highly efficient with a long tool life when machining exotic alloys such as titanium alloys and cobalt-chrome alloys.

■ Sintered Composition (SEM Image)



SUMIBORON Binderless



Conventional CBN

■ Physical Values

	SUMIBORON Binderless	Conventional CBN
CBN Content (vol%)	100	90 to 95
Binder	—	WC-Co
Hardness Hv (GPa)	51 to 54	41 to 44
Thermal Conductivity (W/m·K)	180 to 200	100 to 120

Binderless CBN NCB100

New

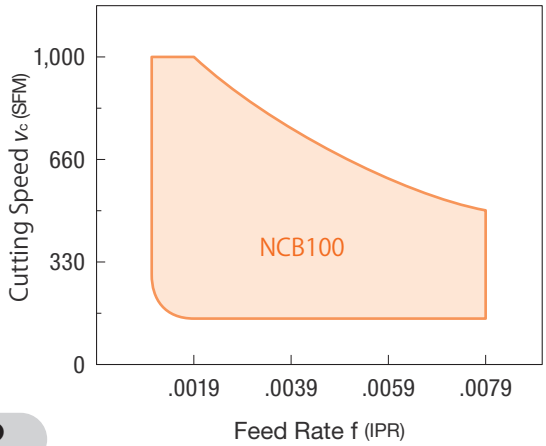
■ General Features

Adopts a nano-polycrystalline CBN sintered cutting edge with hardness and thermal conductivity significantly higher than conventional sintered CBN. Enables overwhelmingly longer tool life and improved efficiency and machining accuracy when machining exotic alloys such as titanium alloys or cobalt-chrome alloys.

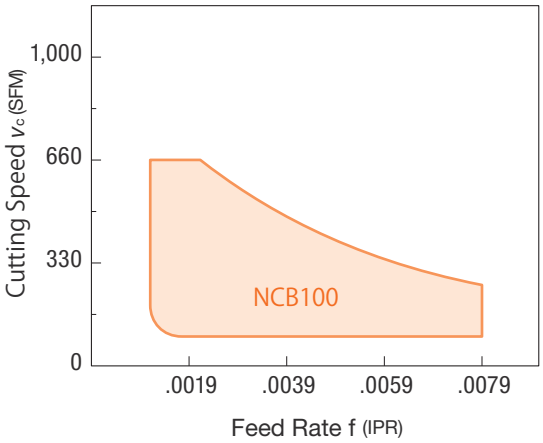
■ Features

- Ideal for high efficiency finishing of exotic alloys such as titanium alloys and cobalt-chrome alloys
  Exhibits outstanding wear resistance due to the excellent hardness and thermal conductivity of nano-polycrystalline CBN
- Excellent dimensional tolerance and machined surface roughness maintained for extended periods
  Tool replacement count can be drastically reduced compared to conventional grades, enabling work efficiency to be improved and total costs to be reduced

■ Application Range (Machining Titanium Alloy)



■ Application Range (Cobalt-chrome alloy machining)

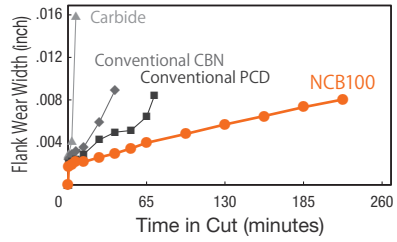


NCB100

K Cast Iron | S Exotic Alloy | Cemented Carbide | Hard Brittle Material

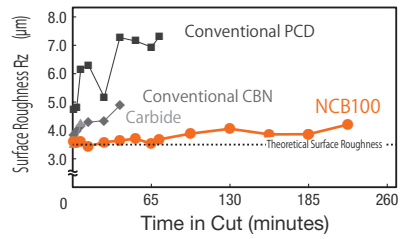
■ Cutting Performance (Machining Titanium Alloy)

• Wear Resistance



Part Material: Titanium Alloy (Ti-6Al-4V)
Tool Used: CNGA432
Cutting Conditions: V_c = 500 SFM, f = .0059 IPR
a_p = .0197" Wet (High Pressure Coolant)

• Machined Surface Roughness



Part Material: Titanium Alloy (Ti-6Al-4V)
Tool Used: CNGA432

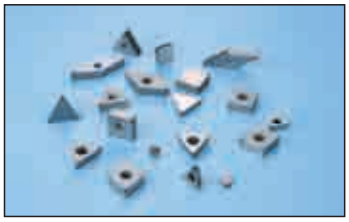
Selection Guide

■ **Cutting Performance (Machining Titanium Alloy)**

One-Use Insert NU Type / NS Type



■ **Features**

- Affordable version of the previously expensive sintered CBN material, at its best size.
- Single-use type eliminates regrinding, making tool management easy.
- Reduce required storage space with 10pcs pack.

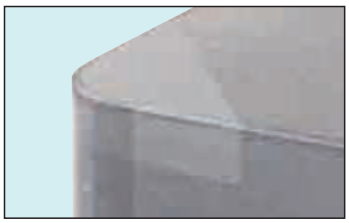
Multi-Cornered, One-Use Insert

■ **Features**

- Multiple CBN cutting edges are brazed onto one insert. Price per edge is lower than normal single-corner, single-use inserts.
- Coated CBN is available as a double-faced insert. Diamond type inserts have 4 cutting edges and triangular inserts have 6 cutting edges.
- Multi-cornered one-use type has G-class tolerance with side faces ground. In addition, all edges are numbered for easy cutting edge management.

One-Use Wiper Inserts

WG / WH Type

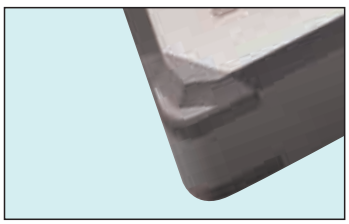


■ **Features**

- SUMIBORON single-use insert with wiper edge for hardened steel machining.
- Excellent surface roughness comparable to grinding.
- Improved machining efficiency is possible with higher speeds and feeds.
- Lineup of low feed WG types and high feed WH types.

One-Use Insert With Chipbreaker

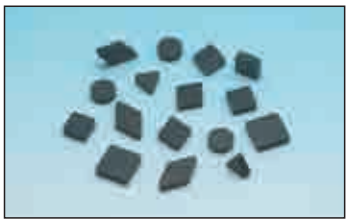
Break Master FV Type / LV Type / SV Type



■ **Features**

- Single-use CBN insert with chipbreaker. SV type is ideal for carburised layer removal, while LV and FV types are ideal for hardened steel machining.
- Chipbreaker incorporated on the CBN cutting edge to maintain chip control capabilities throughout the machining process.
- Unique chipbreaker design can be applied to both hardened and non-hardened parts with effective chip control.

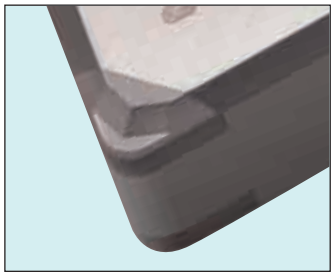
Solid CBN



■ **Features**

- BNS800 realizes a 100% solid CBN structure.
  With no brazed portion, this grade is excellent for the roughing of cast iron at large depths of cut.

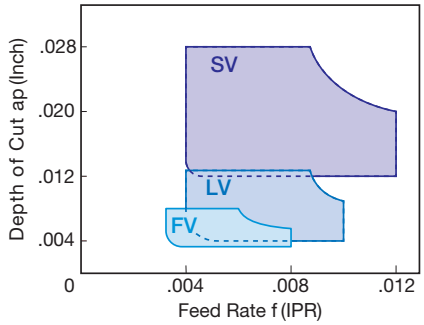
FV / LV / SV



■ Features

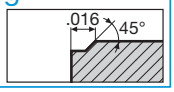
- One-use CBN - SUMIBORON insert with chipbreaker. SV type is ideal for carburized layer removal, while FV and LV types are ideal for hardened steel machining.
- Chipbreaker incorporated on the CBN cutting edge to maintain chip control capabilities throughout the machining process.
- Unique chipbreaker design can be applied to both hardened and non-hardened parts with effective chip control.
- SV lineup includes Coated CBN - SUMIBORON BNC2010/BNC160 for good wear resistance and BNC2020/BNC200, which enables high efficiency machining.
- FV and LV lineup include Coated CBN - SUMIBORON BNC2020/BNC200 for general purpose, BNC2010/BNC160 for good wear resistance and CBN - SUMIBORON BN2000 also for general purpose.

■ Application Range



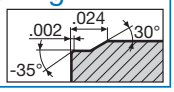
FV For Finishing

Excellent chip evacuation under finishing conditions with depth of cut at .008" or below



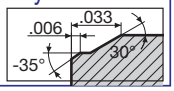
LV For Light Cutting

Excellent chip evacuation with depth of cut at .012" or below



SV For Carburized Layer Removal

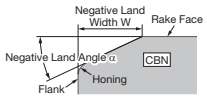
Ideal for carburized layer removal
Eliminates choked stoppages and dimensional defects



■ FV / LV / SV Cutting Edge Specifications

Type	Series	Notation	Cutting Edge Specification Identification Code	α	W	Honing
With Chipbreaker	FV	N-FV	—	0°	0	Yes
	LV	N-LV	S00535	35°	.002	Yes
	SV	N-SV	S01235	35°	.005	Yes

Cutting edge specification identification code S 0 0 5 3 5

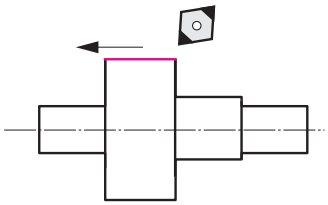


Negative land width
Negative land angle
Cutting Edge Shape T: Negative Land
S: Negative Land + Honing

Example: S00535
→ 35°/.002" Negative Land with Honing

■ Application Examples

External Carburized Layer Removal



· No constant stoppages or incorrect part dimension problems and the chips are small.
· Double the tool life of competitors' CBN.

Part Material: Low Alloy Steel Carburized Steel (Shaft)
Tool Cat. No.: 4NC-CNGG432SV (BNC200)
Cutting Conditions: v_c=500 SFM, f = .0059 IPR
a_p = .0197", 2 Passes Wet

Break Master SV

Tool Life = 200 pcs

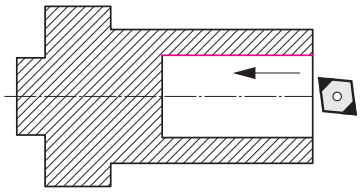
BNC200 (No Breaker)

Tool Life = 200 pcs

Competitor CBN (with chipbreaker)

Tool Life = 100 pcs

Finishing of Hardened Steel



· Improved chip control for internal diameter machining

Break Master FV

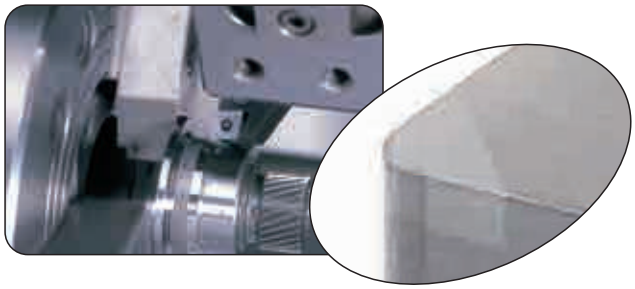
Tool Life = 300 pcs

BNC200 (No Breaker)

Tool Life = 300 pcs

Part Material: Carburized Steel 60HRC (Automotive Component)
Tool Cat. No.: 2NC-CCGT21.51FV (BNC200)
Cutting Conditions: v_c= 265 SFM, f = .0031 IPR
a_p= .0059" Wet

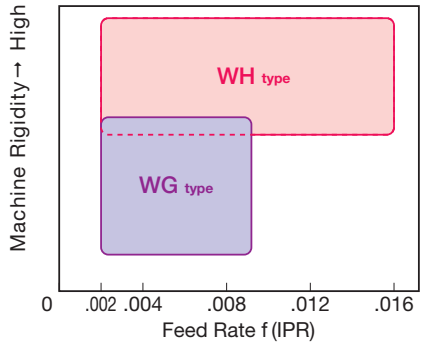
WG / WH



■ Features

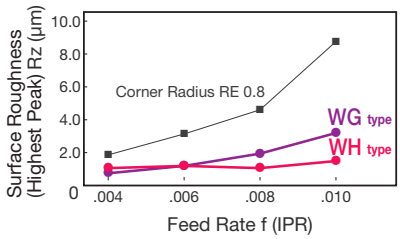
- CBN - SUMIBORON single-use insert with wiper edge for hardened steel machining.
- Excellent surface roughness comparable to grinding.
- Improved machining efficiency with higher speeds and feeds.
- Lineup of standard feed: WG and high feed: WH.

■ Application Range



Use WH type for high-rigidity workpieces and equipment, and WG type for issues of undulation or chatter.

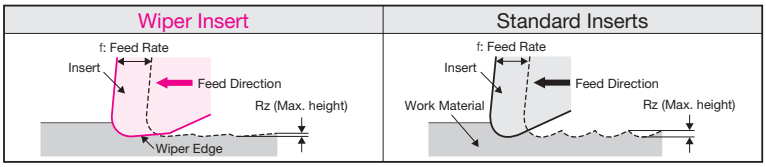
■ Surface Finish



The wiper insert offers good surface finish and improved machining efficiency.

Work Material: SCM415H (60HRC)
Tool Cat. No.: CNGA120408
Cutting Conditions: vc = 443 SFM, ap = .004", Dry

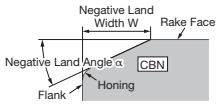
■ Wiper Insert Operation



■ WG type / WH type Cutting Edge Specifications

Type	Series	Notation	Cutting Edge Specification Identification Code	α	W	Honing
Wiper	WG type	WG	S01215	15°	.005	Yes
	WH type	WH	S01215	15°	.005	Yes

Cutting edge specification identification code S 0 1 2 1 5



Negative land width
Negative land angle
Cutting Edge Shape T: Negative Land
S: Negative Land + Honing

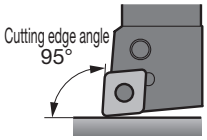
Example: S01215
→ 15°/.005" Negative Land with Honing

■ Precautions when Using Wiper Inserts

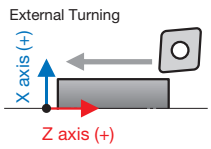
CNGA / CCGA / WNGA

WG Type / WH Type Wiper Insert

- Use a holder with a cutting edge angle of 95°.
- Machining program modification required CNGA / CCGA/ WNGA wiper inserts do not comply with the ISO standard. Correct the cutting edge position (tool offset) as explained on the right.



CNGA / CCGA / WNGA Wiper Insert Cutting Edge Position Offset (WG / WH)

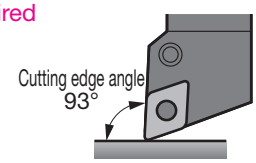


Nose Radius	Type	X-axis direction	Z-axis direction
.0156"	WG	-.0008"	-.0008"
	WH	-.0024"	-.0024"
.0313" / .0469"	WG	-.0004"	-.0004"
	WH	-.0024"	-.0024"

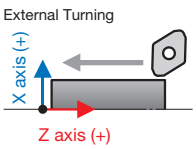
DNGA / DCGA

WG Type / WH Type Wiper Insert

- Use a holder with a cutting edge angle of 93°.
- Machining program modification required DNGA / DCGA wiper inserts do not comply with the ISO standard. Correct the cutting edge position (tool offset) as explained on the right.



DNGA / DCGA Wiper Insert Cutting Edge Position Offset (WG / WH)



Nose Radius	Type	X-axis direction	Z-axis direction
.0156"	WG	-.0067"	-.0004"
	WH	-.0276"	-.0024"
.0313"	WG	-.0020"	0
	WH	-.0228"	-.0020"

Note: Unlike other contour shapes, the DNGA / DCGA can only exhibit wiper effect for outer and inner diameter machining, and cannot be used for facing.

CBN Insert Edge Specification

CBN Insert Edge Treatment

All CBN inserts are enhanced with the optimum cutting edge preparation for the various grades and geometries (shown on the right). This is to avoid cutting edge fracture caused by the heavy loads generated during the machining of high-hardness materials such as hardened steel.
As the pioneer of CBN tools, CBN - SUMIBORON's vast selection of grades and edge treatment combinations makes Sumitomo the world leader for hardened steel machining.

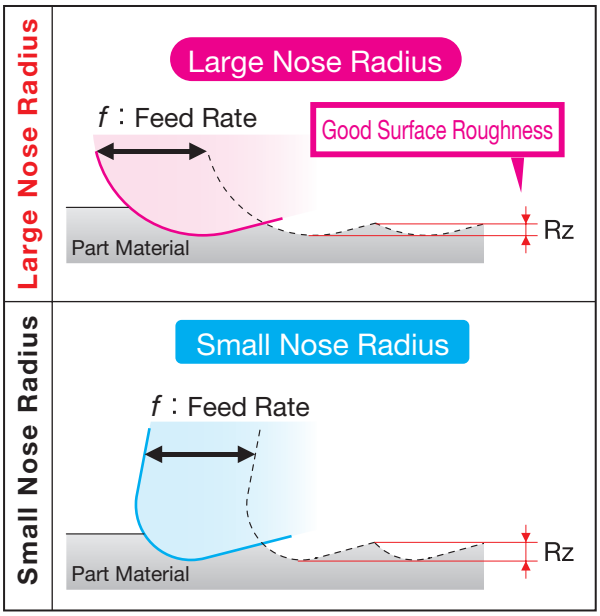
Inserts & Special Holders for High Efficiency Machining

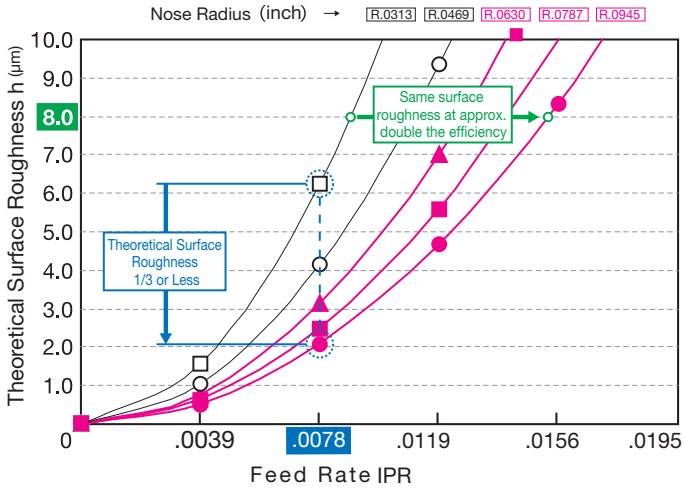
■ Features

- Improved finished surface roughness with high-feed cutting
- Ideal for profiling when when low surface roughness is required

● Operation with different nose radii



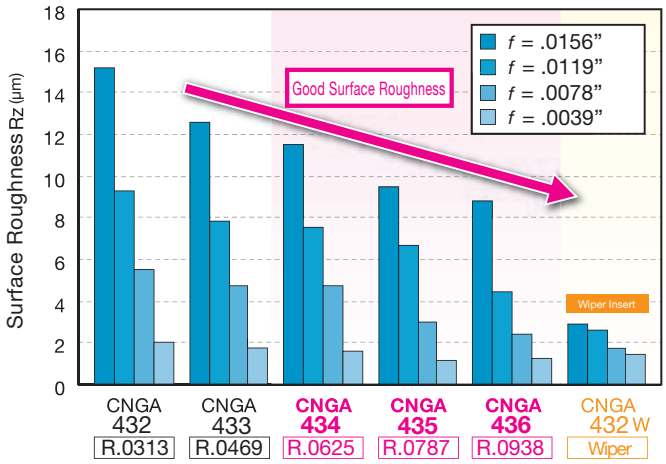
● Comparison of Theoretical Surface Roughness



Feed Rate f = .0079 IPR	Nose Radius .0313" vs. .0938" Comparison **Theoretical surface roughness 1/3 or lower**
Required Theoretical Surface Roughness Rz 8.0μm	Nose Radius .0313" vs. .0938" Comparison **Same surface roughness at approx. double the efficiency**

* Actual value of surface roughness is approximately 1.5 to 3 times higher (for steel).
* Theoretical surface roughness is calculated using the following formula: [$h = (f^2 / 8r) \times 10^3$].

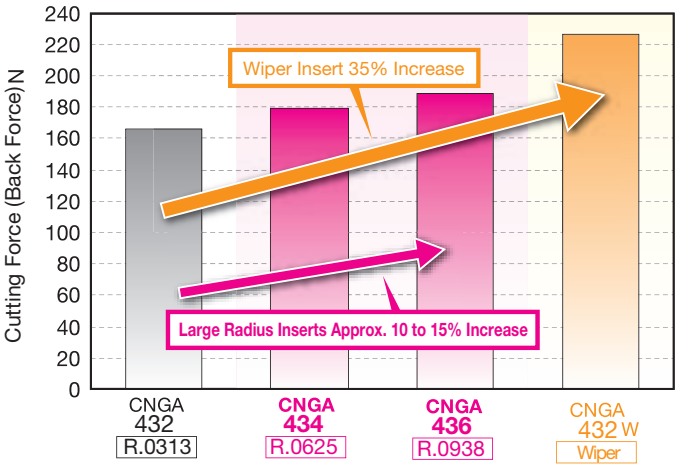
● Machined surface roughness comparison with different nose radii



Inserts with a larger nose radius also give better surface roughness during actual machining

Part Material: Chromium Molybdenum Steel (60HRC)
Cutting Conditions: v_c = 330 SFM, a_p = .0039" Dry

● Cutting force comparison with different nose radii



Low cutting force compared to wiper insert enables high-feed cutting

Part Material: Chromium Molybdenum Steel (60HRC)
Cutting Conditions: v_c = 500 SFM, f = .0117 IPR, a_p = .0039" Dry

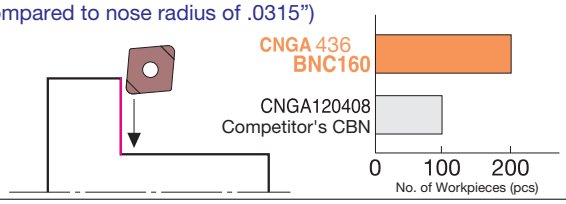
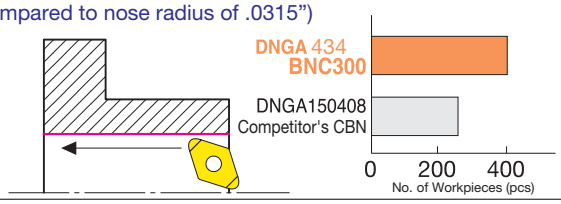
Application Example (For Automotive Components)

Nose radius of .094" achieves 2x greater tool life (compared to nose radius of .0315")



Work Material: Carburised Steel (60HRC)
Cutting Conditions: [R.094"] v_c = 400 SFM, f = .014 IPR, a_p = .0079"
[R.0315"] v_c = 400 SFM, f = .0079 IPR, a_p = .0079"

Nose radius of .0630" achieves 1.5x greater tool life (compared to nose radius of .0315")



Part Material: Carburized Steel (60HRC)
Cutting Conditions: v_c = 330 SFM, f = .0059 IPR, a_p = .0039"

BSME

■ Features

- Achieves the minimum bore diameter of ø2.5mm in boring of hardened steel
- Achieves high-precision cutting edge positioning thanks to the newly developed clamp mechanism
- Expands the range of small hole boring to achieve more high-efficiency machining requiring no grinding
- BSME (Brazed)
  Can be used with work diameters from ø2.5 to 5.0mm
- SEXC (Indexable Insert)
  Can be used with work diameters from ø4.0 to 6.0mm

Expansion | Carbide (Coolant Hole) | CBN

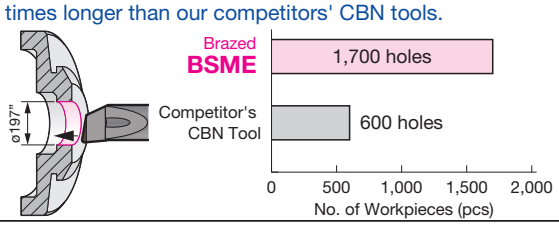
May cause chattering or chipping at the cutting edge during low-speed machining. Excessive depth of cut causes deformation of the tool, which consequently leads to deterioration of dimensional tolerance.

Application Examples

Hardened Alloy Steel Valve Component — BSME

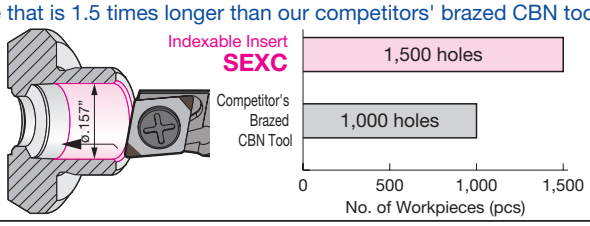
The BSME provides stable machining and a tool life that is over 2 times longer than our competitors' CBN tools.



Part Material: Hardened Alloy Steel Valve Component (Automotive Component)
Tool: BSME R50020D2S6 Grade: BN2000
Cutting Conditions: v_c = 387 SFM (7,500 RPM), f = 0.0008 IPR, a_p = 0.004" Dry

Bearing Steel: Small Automotive Component — SEXC

The SEXC provides drastically reduced tool costs and a tool life that is 1.5 times longer than our competitors' brazed CBN tools.



Part Material: Bearing Steel Small Automotive Component (60HRC)
Holder: E06D2-SEXC R/L03-04P Insert: 2NU-ECXA 030X02LF (BN2000)
Cutting Conditions: v_c = 164 SFM (4,000 RPM), f = 0.0008 IPR, a_p = 0.0008" Wet

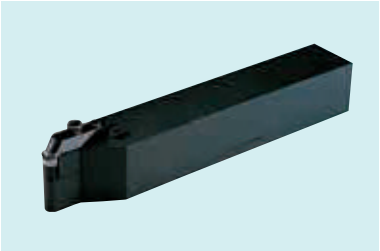
BNRN



- Insert can be reground and used again
  - The same holder can be used for a reground insert by adjusting the slide locator with a clamp.
- Reliable holder design
  - The tip of the clamp is a cemented carbide chipbreaker that can withstand wear from chips.
  - Slide locator uses HSS for durability.

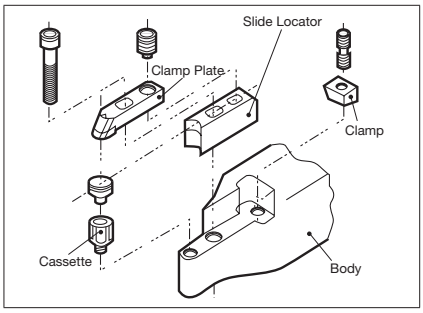
Structure



GWB Type

■ Features

- Vertically-mounted insert enhances tool rigidity
- Double clamping holder design improves stability during continuous and interrupted cutting. Can also be used for traverse cutting
- Long tool life for interrupted cutting applications with the Coated CBN-SUMIBORON BNC30G grade for grooving (BN2000 recommended for continuous cutting)
- Suited for grooving various types of hardened steel. Variety of widths available from .059 to .236" and 1.5 to 6.0mm

Feed Rate f (in.)	Maximum Pitch .118

N·m Recommended Tightening Torque (N·m)

High-speed Finishing for Cast Iron

- High speed finishing cutter for gray cast iron milling that uses removable cartridges enabling simple, precise, run-out adjustment.
- Utilizes BN7000/BN700 grade insert with excellent wear and fracture resistance.
- Available in shell type and small diameter type with shank.

■ Features

- High-speed machining at v_c = up to 6,600 SFM.
- Surpasses Ra 32 µin. finished surface roughness.
- Safety structure for centrifugal force under high-speed cutting conditions.
- Runout is less than 10µm: just attach the cartridge.
- Easy runout adjustment using external setting.
- Running cost is reduced because of the economical insert.

■ Application Range

Grey Cast Iron (200 to 250HB) with pearlite matrix
and Grey cast iron (130 to 160HB) with ferrite matrix
[Example] Engine blocks, cylinder heads, etc.

■ Specifications

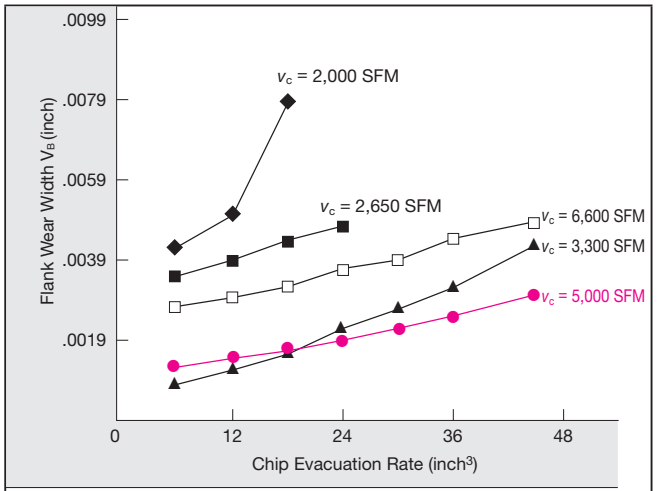
• Shell	ø80 to ø315mm (FMU Type)
With Shank	ø40 to ø63mm (FMU-E Type)
• Regular Blade	SNEW1203ADTR/L
• Low Thrust Blade	SNEW1203ADTR/L-S

■ Recommended Cutting Conditions

• Cutting Speed	v_c = 2,650 to 6,600 SFM
• Feed Rate	f_z = .004" to .012 IPT
• Depth of Cut	a_p = .020" or less
• Coolant	Dry

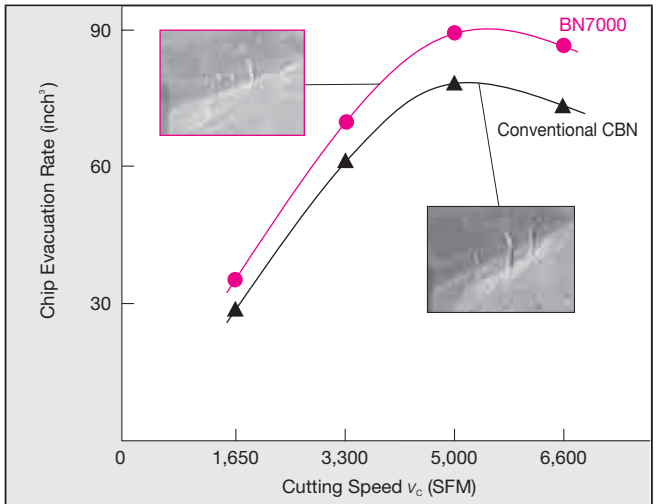
■ Cutting Performance

• Wear Diagram



Part Material: Grey Cast Iron240HB (Pearlite)
Cutting Speed: v_c = 2,000 to 6,600 SFM Feed Rate: f_z = .0059 IPT
Depth of Cut: a_p = .0197" , Dry Tool Grade: BN700

• Estimated Tool Life



Part Material: Grey Cast Iron(Pearlite)
Cutting Speed: v_c = 1,650 to 6,600 SFM Feed Rate: f_z = .0079 IPT
Depth of Cut: a_p = .0118" Dry Tool Cat. No.: FMU4100R SNEW1203ADTR

Milling of ductile cast iron and alloy steel casting does not produce the best results. Dry cutting is recommended. Wet cutting will result in breakage of cutting edges in the early stages due to thermal cracking.

⚠ CAUTION

- · Do not use inserts with different catalogue numbers, such as a mix of standard and wiper inserts, on a single cutter setting.
- · New and reground inserts cannot be mixed for use. Use either only new inserts or only reground inserts.
- · Inserts can only be reground once (inscribed circle dimension must be at least 9.125mm).

Recommended Cutting Conditions

ISO	Work Material	Hardness	Cutting Speed v_c (SFM) Min. - Max.	Feed Rate f_z (IPT) Min. - Max.	Insert Grade
K	Gray Cast Iron	250HB	2,625 - 5,000	0.002 - 0.008	BNS800 (Dry)

Note The cutting conditions above are a guide. Actual conditions will need to be adjusted according to machine rigidity, work clamp rigidity, depth of cut and other factors.

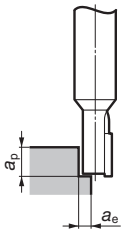
Grade: BN350

Recommended Cutting Conditions

1. Use dry cutting (air blow) conditions.
2. Down cut (climb milling) is recommended.
3. Make overhang as short as possible and use a high-rigidity machine.



Surface Milling

Part Material (Hardness)	High-Hardness Hardened Steel (50 to 57HRC)		
Cutting Conditions	Cutting Speed V_C 100 to 170m/min		
DC(mm)	Spindle Speed (min^{-1})	Feed Rate (mm/min)	Depth of Cut a_e (mm)
ø6 to 8	4,000 to 9,000	240 to 540	up to 0.1
ø10 to 12	2,700 to 5,400	180 to 360	up to 0.15
ø14 to 16	2,000 to 3,800	140 to 260	up to 0.2

Part Material (Hardness)	High-Hardness Hardened Steel (58 to 65HRC)		
Cutting Conditions	Cutting Speed V_C 80 to 150m/min		
DC(mm)	Spindle Speed (min^{-1})	Feed Rate (mm/min)	Depth of Cut a_e (mm)
ø6 to 8	3,200 to 8,000	150 to 370	up to 0.08
ø10 to 12	2,100 to 4,800	120 to 370	up to 0.12

Recommended Cutting Conditions

1. Use a machine with high rigidity for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant.
   Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions as necessary as machine rigidity and other conditions may vary.
5. Depths of cut shown in the table of conditions are maximum depths. Adjust the actual depth of cut to the desired machined surface roughness.

Recommended Cutting Conditions

1. Use a machine with high rigidity for stable cutting.
2. Non-water soluble cutting oil is recommended. Supply as a mist or external coolant.
   Take fire prevention precautions to avoid fire hazards caused by sparks igniting during machining or tool breakage.
3. Shorten overhang as much as possible.
4. Adjust cutting conditions according to actual conditions as machine rigidity and other conditions may vary.
5. Depths of cut shown in the table of conditions are maximum depths. Adjust the actual depth of cut to the desired machined surface roughness.

Recommended Cutting Conditions

1. Use a high-rigidity machine and select a high cutting speed with a low feed rate.
2. Use dry cutting conditions.
3. Make overhang as short as possible.
4. If the work material hardness is lower than 50HRC, try the GSX Ballnose endmill .

PCD Inserts

■ General Features

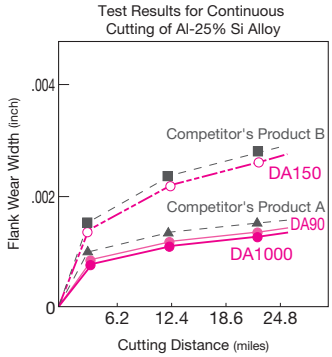
Sumitomo PCD - SUMIDIA® sintered diamond series has 4 grades (DA90, DA150, DA2200, DA1000) with individual features depending on the optimum combination of diamond particle size and binder, as well as the NPD10 grade (nano-polycrystalline diamond) where nano-order diamond particles are directly bound with high strength without using binders.
PCD is suited for a wide range of applications from machining of aluminum alloy to machining of hard brittle materials and cemented carbide.

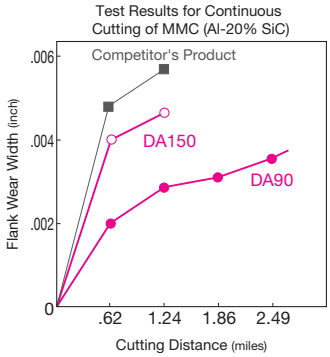
■ Grades, Features and Applications

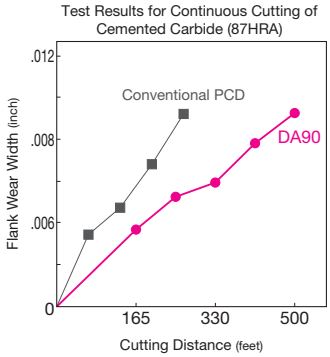
Grade		Features	Applications	Average grain size of diamond particles (μm)	Hardness HK (GPa)	Transverse Rupture Strength (GPa)
SUMIDIA Binderless	NPD10	100% diamond structure that directly binds nano-order diamond particles with high strength. Demonstrates optimum wear and fracture resistance as well as the best edge sharpness.	· Finishing of Cemented Carbide · Machining of Hard Brittle Material (Ceramics)	up to 0.05	120 to 130	≈ 3.15
SUMIDIA®	DA1000	High-density sintered grade made of ultra-fine grained diamond that demonstrates excellent wear and fracture resistance as well as edge sharpness.	· Machining of High-Silicon Aluminum Alloy · Rough, Interrupted and Finishing Machining of Aluminum Alloy · Woodcraft or Wooden Board Cutting/ Facing · General Finishing of Non-Ferrous Metals	up to 0.5	50 to 60	≈ 2.60
	DA2200	Sintered grade made of ultra-fine grained diamond that demonstrates optimum wear and fracture resistance and excellent edge sharpness.	· Rough, Interrupted and Finishing Machining of Aluminum Alloy · Woodcraft or Wooden Board Cutting/ Facing	0.5	45 to 55	≈ 2.45
	DA150	Grade with micro-grained sintered diamond particles. With strong diamond particle bonding, it has an excellent balance of machinability and wear resistance.	· General Finishing of Non-Ferrous Metals · Finishing of Semi-Sintered Ceramics and Mold-Extruded Products · FRP, Hard Rubber & Carbon Cutting · Wooden or Inorganic Board Cutting/Facing	5	50 to 60	≈ 1.95
	DA90	Contains coarser diamond particles than other grades, giving it good wear resistance suitable for the machining of carbides and high-silicon aluminum. Shows the highest diamond content for excellent wear resistance.	· Machining of High-Silicon Aluminum Alloy · Machining of Aluminum Composite (MMC) · Green or Semi-Sintered Cemented Carbide & Ceramic Roughing · Machining of Sintered Ceramics/Stone/ Rock	up to 50	50 to 65	≈ 1.10

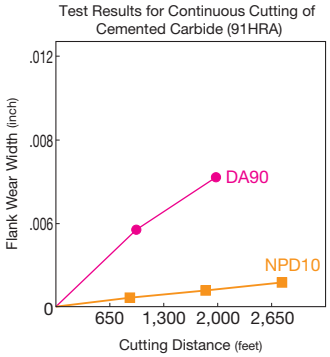
Transverse rupture strength measured with test piece equivalent to insert PCD layer

■ Performance









Part Material : Al-25% Si alloy
Tool Cat. No. : SPG421
Holder : FP11R
Cutting Conditions : v_c=1,640 SFM, f=0.004 IPR, a_p=5.1" Dry

Part Material : MMC (Al-20%SiC)
Tool Cat. No. : CNMX432
Holder : PCLN2525
Cutting Conditions : v_c=1,150 SFM, f=0.008 IPR, a_p=4.5" Wet

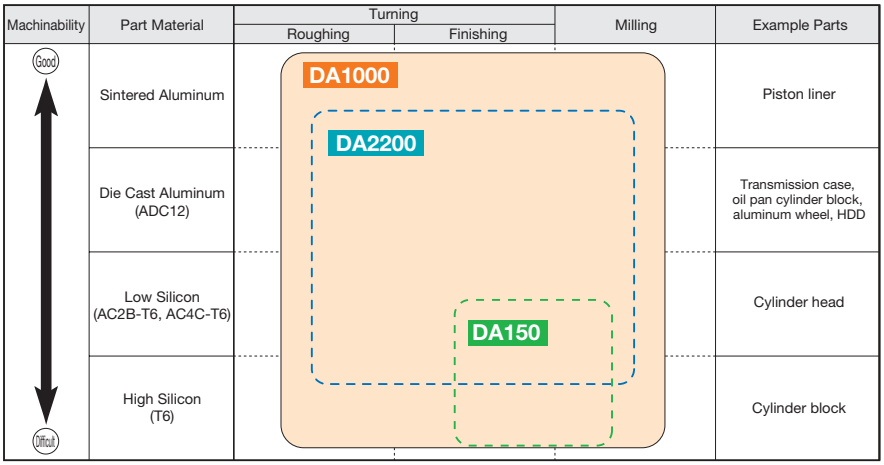
Part Material : Cemented carbide (87HRA)
Tool Cat. No. : NF-DCMA21.51
Cutting Conditions : v_c = 65 SFM, f = 0.004 IPR, a_p = 5.1" Wet

Part Material : Cemented carbide (91HRA)
Tool Cat. No. : DCMA32.51RH (NPD10) NF-DCMW11T304 (DA90)
Cutting Conditions : v_c = 65 SFM, f = 0.002 IPR, a_p = 1.27" Dry

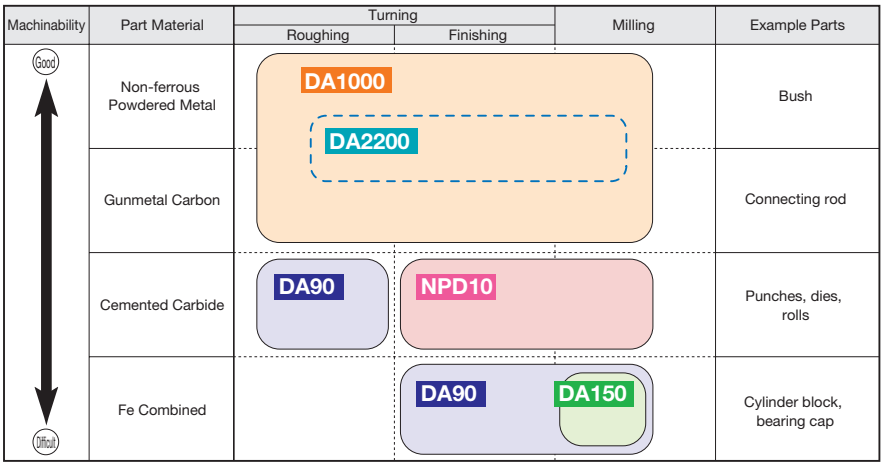
PCD Inserts

■ Application Range

● Aluminum



● Non-aluminum



■ Recommended Cutting Conditions

Part Material	Cutting Speed v_c(SFM)	Feed Rate f(IPR)	Depth of Cut a_p(inch)
Aluminum Alloy	up to 9,850	up to 0.008	up to 0.12
Copper Alloy	up to 3,300	up to 0.008	up to 0.12
Reinforced Plastics	up to 3,300	up to 0.016	up to 0.079
Wooden or Inorganic Board (cutting, etc.)	up to 13,100	up to 0.016	—
Cemented Carbide	up to 100	up to 0.008	up to 0.0197
Carbon	330 to 1,970	0.04	0.079

■ PCD (SUMIDIA) Grinding Method

Functions		Description
Grinding Machine	—	(1) A special-purpose high-rigidity grinding machine. (2) Capable of wet grinding operations.
Grinding Wheel	Abrasive Grain	Diamond
	Grain Size	Rough Grinding: 400 mesh, Finish Grinding: 800 to 1,500 mesh
	Bond	Vitrified or Metal Bond Dedicated for Polycrystalline Diamond Tool
	Concentration	100 to 125
	Dressing	Use a WA stick with a mesh of about 400.
Grinding Conditions	Peripheral Speed	2,600 to 3,300 SFM
	Table Rocking	30 to 60 cycle/min
	Grinding Fluid	Water-soluble Grinding Fluid (Solution Type)
Others	—	(1) The rake face is generally lapped. (2) Inspect for edge chipping using a microscope with a magnification of 30 to 50 times. (3) Machining of non-ferrous metals requires a sharp cutting edge. (4) Surfaces that were cut by EDM should have more than 0.002" ground off.

*Please contact us for details on regrinding of NPD10.

PCD - SUMIDIA Binderless Inserts

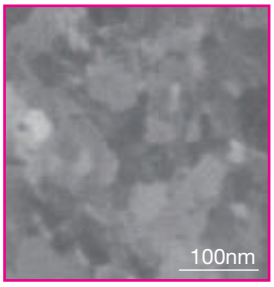
Nano-Polycrystalline Diamond

■ General Features

Nano-polycrystalline diamond is polycrystalline diamond that directly binds nano-order diamond particles with high strength without using any binders. This proprietary Sumitomo material is harder than polycrystalline diamond with a binder, achieving excellent wear resistance and fracture resistance.
Binderless PCD tools use this super-high-performance nano-polycrystalline diamond material in their cutting edges.

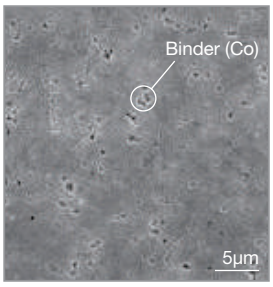
■ Comparison of Structures

Nano-Polycrystalline Diamond Tool SEM Profile



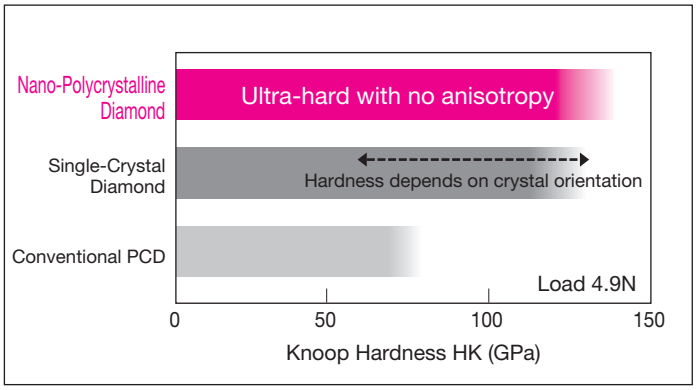
Diamond particles (30 to 50nm)

Conventional PCD SEM Profile



Diamond particles (1 to 10μm)

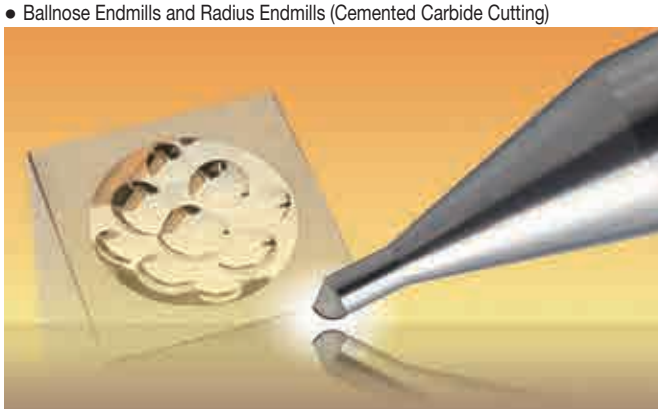
■ Hardness



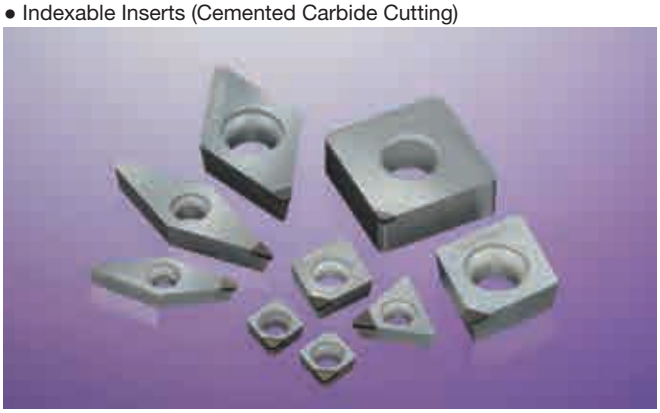
PCD - SUMIDIA - Binderless

■ Application Examples

● Ballnose Endmills and Radius Endmills (Cemented Carbide Cutting)

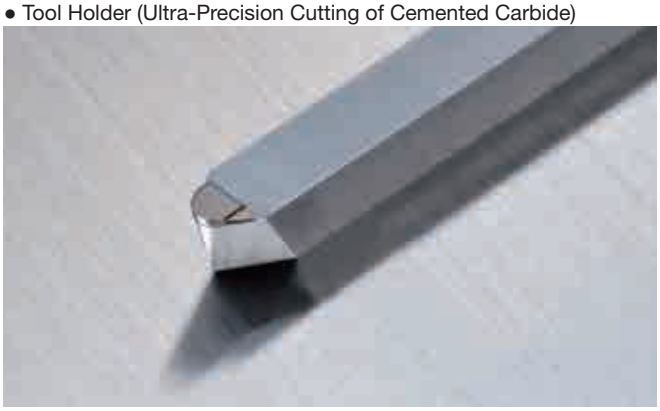


● Indexable Inserts (Cemented Carbide Cutting)



● Drill (Drilling of Ceramics)

● Tool Holder (Ultra-Precision Cutting of Cemented Carbide)



NPD10/DA90

■ General Features

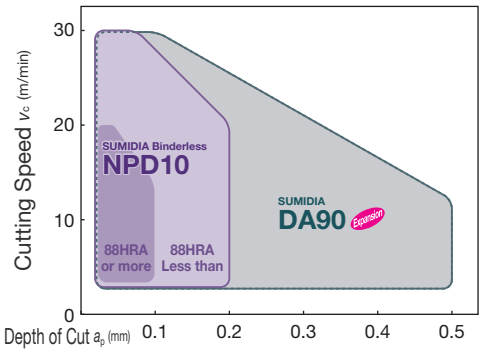
NPD10 is made from high-hardness nano-polycrystalline diamond. This is a pure diamond material, but unlike single-crystal diamonds, it has no anisotropy.
It achieves extended tool life and machining accuracy superior to conventional diamond tools when machining hard brittle materials such as cemented carbide.

DA90 is a PCD - polycrystalline diamond grade in which coarse diamond particles have been sintered to form a dense structure. The high diamond content, with high wear resistance, makes it ideal for roughing of cemented carbide and hard brittle material.
Optimized design and mass production technology have been developed, achieving the same performance as conventional tools with higher cost-performance.

■ Features

- Ideal for Finishing of Hard Brittle Materials Including Cemented Carbide (NPD10)
  High-precision cutting of cemented carbide thanks to the outstanding wear resistance of nano-polycrystalline diamond
- Superior dimensional tolerance maintained for a long time (NPD10)
  Tool replacement count can be drastically reduced compared to conventional diamond tools, enabling work efficiency to be improved and total costs to be reduced.
- Ideal for Roughing of Hard Brittle Materials Including Cemented Carbide (DA90)
  Stable tool life in sintered surface machining of cemented carbide and roughing of hard brittle materials thanks to the outstanding wear resistance of the coarse-grained polycrystalline diamond
- Uses PCD - SUMIDIA NF Insert (DA90)
  Optimized design and mass production technology have been developed, achieving the same performance as conventional tools with higher cost-performance.

■ Application Range (Cemented Carbide Machining)



■ Applications of NPD10 and DA90 (Cemented Carbide)

Grade	SUMIDIA Binderless NPD10		SUMIDIA DA90	
Dimensional Tolerance	◎	Best	△	The first recommendation is NPD10
Tool Life (Wear Resistance)	◎	Best a_p = 0.008" or below f = 0.004 IPR or below recommended	○	a_p = 0.008" or above can also be used
Sintered surface machining of cemented carbide	×	Impossible	◎	Best
Machined surface quality	◎	Best	△	The first recommendation is NPD10

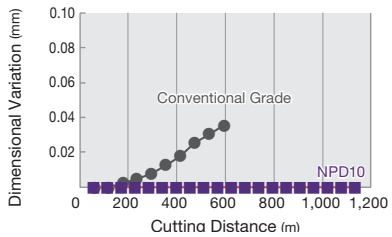
■ Recommended Cutting Conditions (Cemented Carbide Machining)

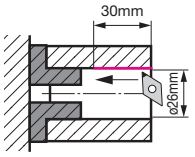
Part Material				Grade	Cutting Conditions		
Class		Hardness (HRA)	Our Grades		Cutting Speed v_c (SFM)	Feed Rate f (IPR)	Depth of Cut a_p (Inch)
VM, VC	40	88 or more	G5, D2	NPD10	15 - 65	.0012 - .0027	.0012 - .0027
VM, VC	70, 60, 50	83 less than 88	G7, G6	NPD10	15 - 100	.0012 - .0079	.0012 - .0079
VM, VC	—	83 or more	G7, G6 G5, D2	DA90	15 - 100	.0012 - .0079	.0012- .0197

Min. - Max. Coolant: Dry (NPD10)/Wet (DA90)

■ Machining Precision (NPD10)

Internal machining of cemented carbide: VM30 (91HRA)



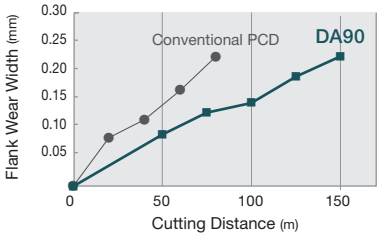


NPD10 shows no dimensional variation even after 1,100m of cutting.

Part Material : Cemented carbide: VM30 (91HRA)
Tool Cat. No. : DCMA32.51RH
Cutting Conditions : v_c=65 SFM, f=0.002 IPR, a_p=0.002" Dry

■ Wear Resistance (DA90)

External machining of cemented carbide: VC50 (87HRA)



Part Material : Cemented carbide: VC50 (87HRA)
Tool : NF-DCMA21.51
Cutting Conditions : v_c=65 SFM, f=0.004 IPR, a_p=0.008" Wet

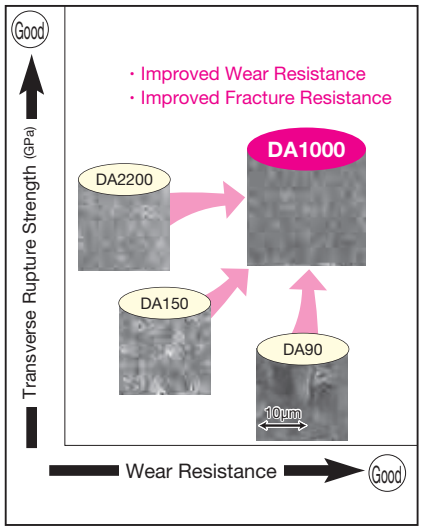
DA1000

■ Features

Ultra-high-density sintered ultra-fine grained diamond

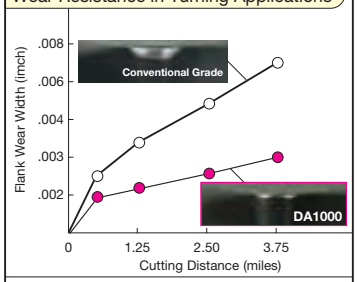
- Significantly improved surface roughness on machined surfaces
- Excellent wear resistance and strength
- High-performance, high-precision, high-efficiency machining of all aluminum and non-ferrous alloys

■ Position of DA1000

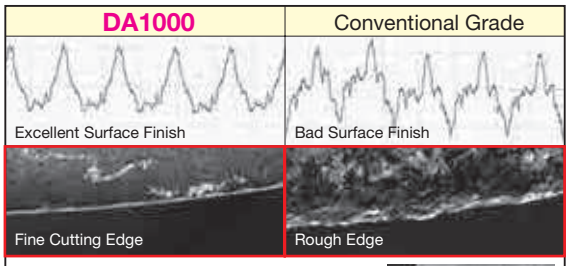


■ Cutting Performance

Wear Resistance in Turning Applications



Part Material : 17% Si-Al Alloy
Tool Cat. No. : TPG321
Cutting Conditions : v_c =2,600 SFM, f =0.005 IPR
a_p =0.0197" Wet



Part Material : 17% Si-Al Alloy
Tool Cat. No. : TPGA322
Cutting Conditions : v_c=3,300 SFM, f =0.006 IPR
a_p = 0.008" Wet

■ NF Insert

The NF PCD insert uses optimized design and improved mass production techniques that maintain good performance of DA1000 yet offer higher cost efficiency. It makes the most of the PCD - SUMIDIA DA1000 grade, with excellent fracture and wear resistance and good work material finished surface roughness.

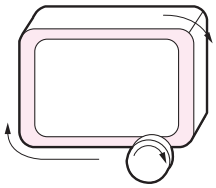
NF Insert Cutting Edge SEM Profile

High-precision cutting edge quality

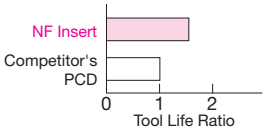
- Total cost effectiveness with high performance and lower price
  - ・Optimum design utilizing improved mass production techniques provides a lower cost.
  - ・Regrindable type results in huge total cost reduction.
- Wide lineup from general turning to milling
  - ・Wide range of items in stock for small diameter boring and external turning to milling.
  - ・Negative/positive type inserts that can be used on standard lever-lock and pin-lock type holder are also in stock.

■ Application Examples

● Milling of Aluminum Alloy Oil Pump Cover

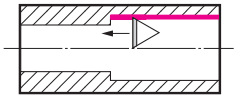


Results:
1.5 times longer tool life than competitors' PCD, with higher cost performance.

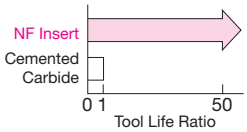


Part Material : A383 Aluminum, Tool Cat. No.: NF-TEEN32R
Cutting Conditions : v_c = 9,850 SFM, f_z = 0.0024 IPR, a_p = 0.008" Wet

● Boring of Aluminum Valve Bore



Results:
No initial breakage, tool life is more than 50 times that of carbides.



Part Material : A383 Aluminum, Tool Cat. No.: NF-TPG221P
Cutting Conditions : v_c = 1,750 SFM, f = 0.00197 IPR, a_p = 0.008" Wet

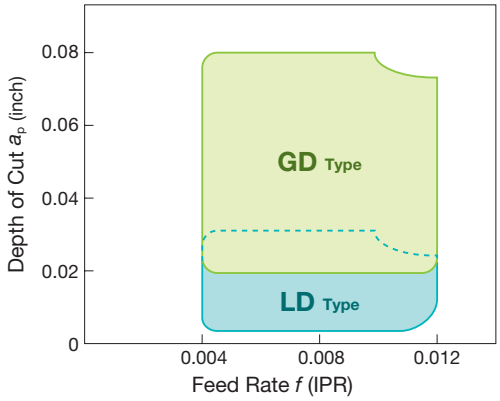
LD / GD

■ Features

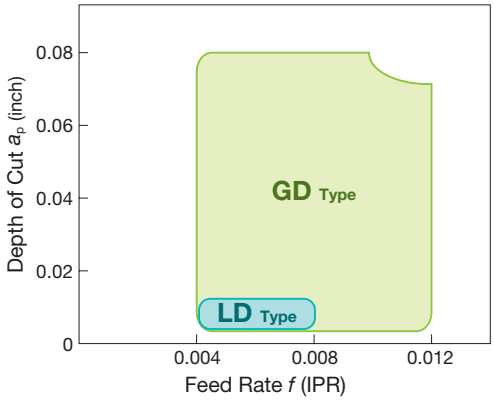
- PCD insert with chipbreaker
- Provides excellent chip control in medium finishing and finishing of aluminum alloy.
- Solves chip control problems and dramatically improves work efficiency.
- Achieves long, stable tool life by employing high-toughness grade DA1000.

■ Application Range

- Wrought Aluminum Alloy (6061)



- Cast Aluminum Alloy (A383)



LD Type Chipbreaker for Finishing

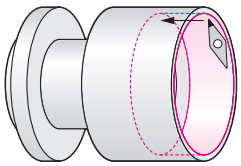
Provides excellent chip control in finishing

■ Cutting Performance

For Wrought Aluminum Alloy Machining

- Machining Details: Internal Diameter Machining of Machine Components

Provides good chip control at shallow depths of cut for wrought materials



Break Master LD Type

Without Chipbreaker

Part Material: 6061 Aluminum, Tool Cat. No.: NF-VCMT220.5LD (DA1000)
Cutting Conditions : v_c = 650 SFM, f = 0.008 IPR , a_p = 0.004" Wet

GD Type Chipbreaker for Medium Finishing

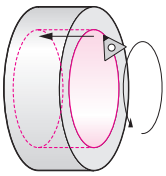
Provides excellent chip control in medium finishing

■ Cutting Performance

For Aluminum Alloy Casting Machining

- Machining Details: Internal Diameter Machining of Transmission Components

Finely breaks chips in machining of cast materials



Break Master GD Type

Without Chipbreaker

Part Material: A383 Aluminum, Tool Cat. No.: NF-TPMT221GD (DA1000)
Cutting Conditions : v_c = 1,312 SFM, f = 0.009 IPR, a_p = 0.087" Wet

Note: Regrinding this product will adversely affect chip control performance.

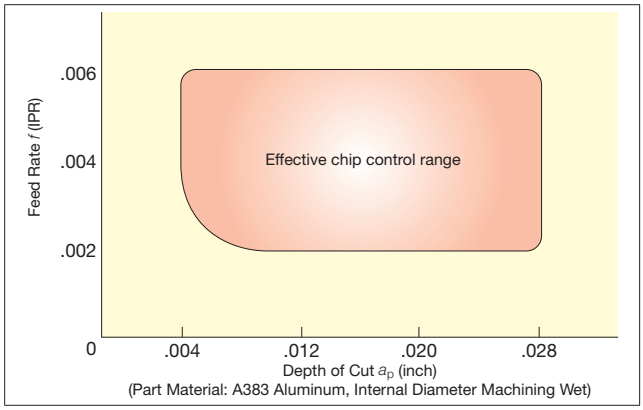
DM

■ Features

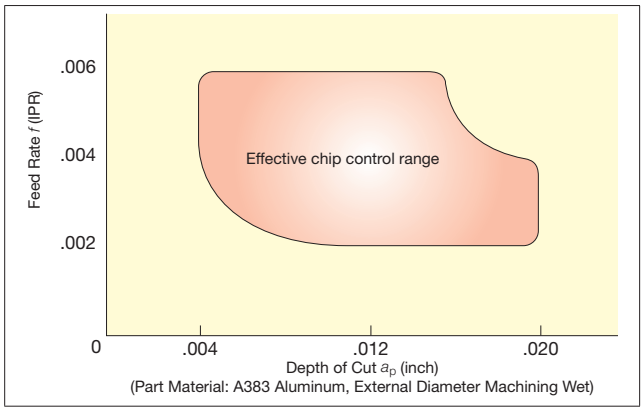
- Economy One-Use Type
  Familiar to users of CBN - SUMIBORON one-use inserts, now available in PCD - SUMIDIA.
- Cutting Edge with Built-in Chipbreaker for Effective Chip Control
  DM Type chipbreaker solves chip control problems and greatly improves efficiency.

■ Application Range

- For Internal Diameter Machining



- External Turning & Facing (Insert Shape: 55°/80° Diamond Type)



■ Chip Control

- Chips Created by Break Master DM Type

- Chips with No Chipbreaker

■ Application Examples

Machining Details	Cutting Conditions	Results
Internal Boring	Part Material: Aluminum Alloy (AC2A-T6) v_c = 985 SFM f = 0.0024 IPR a_p = 0.014" Wet	With the required finished surface roughness of Ra = 1μm or less, the chips curled at lengths of 2mm or so, and did not remain within the work material.

■ Recommended Cutting Conditions

- Internal Diameter Machining (Insert Shape: Triangular Type)

Feed Rate *f*	Depth of Cut a_p	Coolant
up to .006 IPR	up to 0.028"	Wet

- External Profiling (Insert Shape: 55°/80° Diamond Type)

Feed Rate *f*	Depth of Cut a_p	Coolant
up to .006 IPR	up to 0.0197"	Wet

For facing, depth of cut should be less than 0.016".

■ General Features

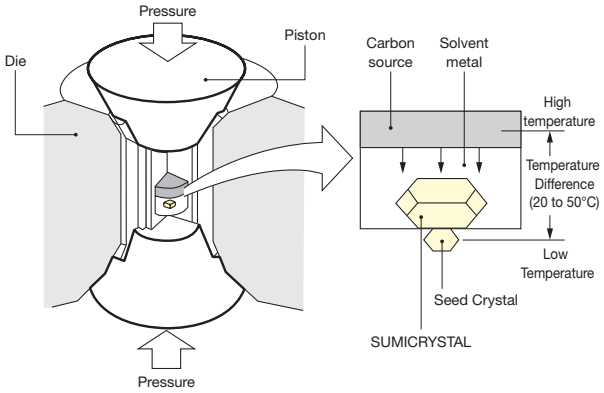
SUMICRYSTAL is the world's first commercially available large-grained high-purity single-crystal diamond, developed by Sumitomo.
Thorough quality control has achieved stable quality, making SUMICRYSTAL ideal as an industrial material.

■ Production Method

The synthetic single-crystal diamond SUMICRYSTAL is synthesized in a super high pressure chamber from 5 to 6GPa and high temperatures from 1,300 to 1,600°C. The temperature difference between the raw carbon and the seed crystal is used to grow the diamond on the seed crystal. Through this stringent control of pressures and temperatures, a more stable structure with minimal impurities can be obtained.

● Inside a super high pressure chamber

Synthetic Conditions
Pressure: 5 to 6GPa
Temperature: 1,300 to 1,600°C

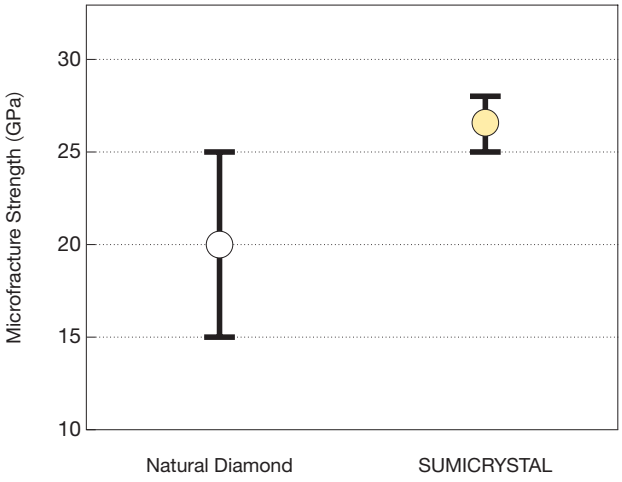


■ Properties

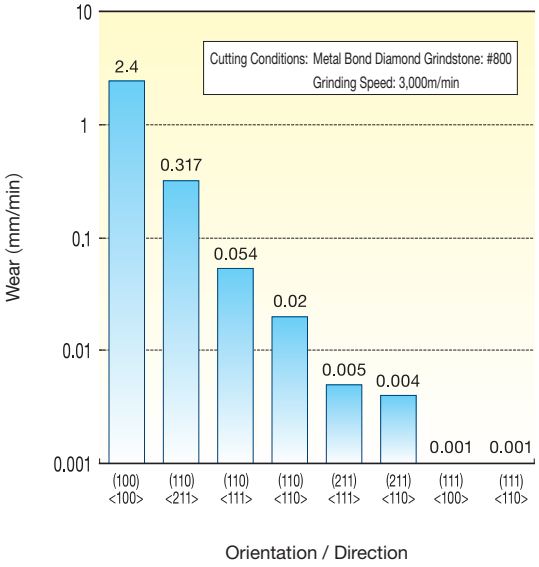
SUMICRYSTAL has 4 main advantages over natural diamond.

1) Structural advantage: Natural diamond is rounded and the crystal orientation is difficult to determine with the naked eye. SUMICRYSTAL, however, has a distinct crystal face which makes the identification much easier.
2) Uniformity: Due to the strictly controlled conditions in which the crystals are grown, uniform quality is obtained consistently.
3) Availability: Unlike the limited supply of natural diamonds, SUMICRYSTAL can be mass produced.
4) SUMICRYSTAL diamond type Ib, which is used for tools, has mechanical and thermal properties equal to or even greater than natural diamond, while containing trace amounts of nitrogen impurities.

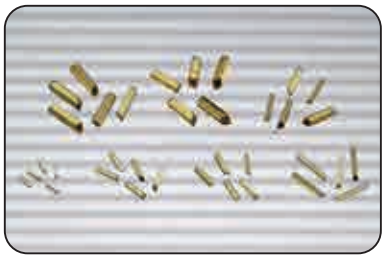
● Microfracture Strength of Synthetic Diamond



● Orientation and Wear Resistance



PD / PDX



■ General Features

SUMICRYSTAL PD and PDX are single-crystal synthetic diamonds processed into thin prism shapes for use as dresser blanks. Their stable performance and long tool life improve dressing precision.

SUMICRYSTAL PD

■ Features

● Revolutionary Elongated Shape

(1) Improved retention strength prevents diamonds from falling out.
(2) Consistent cross-section prevents deterioration.
(3) Uniform crystal orientation promotes stable tool life.

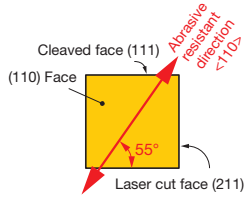
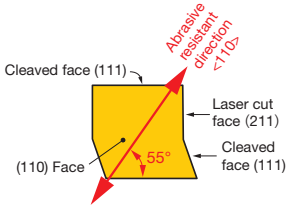
* 1 Sizes other than those indicated above can be ordered. ● mark: Standard stocked item
* 2 These products may have fine impurities within Sumitomo's prescribed range.
* 3 The laser cut faces among other product areas may have chipping within Sumitomo's prescribed range.

■ PD Crystal Orientation

PD

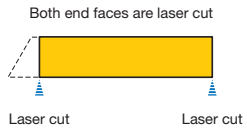


PD-T



■ KK Type

Apart from the standard items listed above, PD is also available in the KK type with both end faces laser-cut.



· When ordering, include "K" after the standard catalogue number. (Example: PD○○○○KK, PD○○○○TKK)

· PD0220 and 0420 are not available in the KK type.

SUMICRYSTAL PDX

■ Features

● Compared to conventional tools (PD), the product has different face crystal orientation.

(1) Crystal orientation (211) provides better tool life than conventional PD blanks.
(2) Parallel abrasive resistant faces (111) facilitate blank setting during manufacturing of dressers.

UP

■ General Features

Of today's sophisticated cutting-edge technologies, ultra-precision machining processes such as those used for optical element molds are seeing particularly rapid development.
SUMICRYSTAL UP blanks have high performance and reliability, making them optimally suited to these applications.

■ Features

(1) High quality with very low variance.
Stable wear resistance with excellent resistance to cutting edge chipping.
(2) Minimal stock removal during cutting edge formation.
Uniform shape facilitates cutting edge formation.

■ Standard Type

Rectangular parallel type with 6 (100) faces.

■ Economy Type

Peripheral growth faces and top are not cut. Benefits include large volume and low cost.

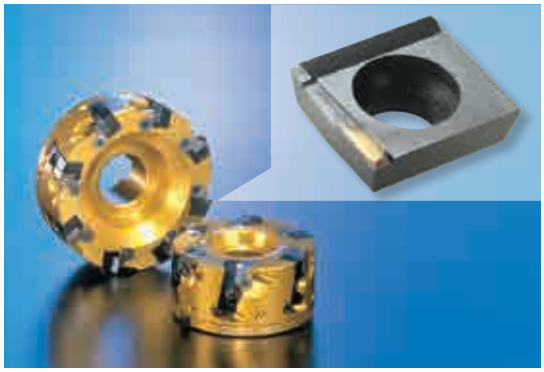
● Cutting Tools Using SUMICRYSTAL UP

Wiper Insert for High-Efficiency Cutter for Aluminum Alloy RF Type →M46



* This product was jointly developed with A.L.M.T. Corp.

SUMICRYSTAL SC10 (Wiper Insert)

- SUMICRYSTAL, a single-crystal diamond produced with SEH's original super-high pressure technology, is used for the cutting edge.
- Edge sharpness is retained better than sintered diamonds, greatly reducing burr formation.

SUMICRYSTAL (Single-Crystal Diamond) Surface machined with SC10 wiper insert

Surface machined with SUMIDIA (Sintered Diamond) wiper insert

UP (Half-Cut Product)

■ General Features

SUMICRYSTAL UP Half Cut products are materials for holders consisting of the UP Economy type material cut in half along the (100) or (110) faces.

■ Features

(1) Grinding during tool production minimizes the volume removed, reducing machining loss.
(2) Similar shape to the completed tool, reducing material costs.
(3) The cut surface is a smooth laser surface.

UPT

■ General Features

SUMICRYSTAL UPT is a material for holders with a 2-point surface ((110) face) as the main surface.

■ Features

(1) 2-point surface ((110) face) enables use for the same applications as with holders using conventional natural diamonds.
(2) Distinctive shape minimizes the volume removed to make the cutting edge, enabling efficient machining.

■ Standard Items

Dimensions (mm)

Shape	Cat. No.	Stock	W	L	T
	**UPT 3010**		3.0	2.5	$1.0^{\pm 0.1}$
	UPT 3012				$1.2^{\pm 0.1}$

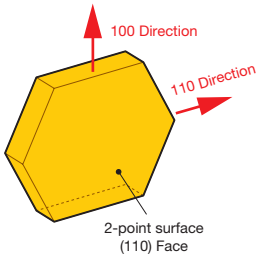
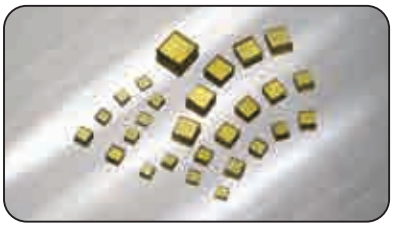
*3 Impurities, chipping, etc. outside the inspection range may be present at the bottom (L/2).

■ UPT Crystal Orientation



CD



■ General Features

SUMICRYSTAL CD has optimized crystal orientation and shape as a material for wire drawing dies. Realizing excellent performance through high quality and stability.

■ Features

(1) High quality with very low variance.
High-quality crystal with minimal impurities, chipping and distortion is used to achieve high, stable wear resistance. It also eliminates the need for inspection and selection of raw stones required for natural diamond.

(2) High fracture strength
Resistant to fracture and cracking during wire drawing.

(3) Accurate crystal orientation
(111) is used on the top and bottom surface, limiting crystal misorientation, which causes variance in tool life, to within 1°.

(4) No grinding needed for top and bottom surface
The top and bottom surface are cleaved to form parallel surfaces, eliminating the need for grinding of the top and bottom surface.

■ Standard Type

The outside is machined by laser, achieving a consistent shape for easy setting. Mounting pressure is applied evenly, ensuring sufficient strength even for small volume. Ideal for applications with limited dimensions, such as nozzles and wire guides.

CNC Holders

Our CNC Holder line provides options for all industry-standard sizes and congurations for collet chucks, end mill holders, shell mill holders, hi-power milling chucks, and face mill holders.

Each product represents the latest technology, and reflects our commitment to quality and innovation. We also support our products with unmatched application expertise and customer service.

Induction Shrink-Fit System

The finest shrink fit holders available. Precise manufacturing and exclusive “Counter Bore” technology optimize the advantages of using shrink fit tooling. These holders ensure the best part finish quality, longer tool life, and higher feed rates and speeds. All of this is accomplished due to micrometer accuracy in runout, high cutting tool rigidity and extremely high clamping forces.

Tightening Fixtures

Our tightening fixtures are the best and simplest in the world. You gain immediate access to both the working and taper ends. Less handling just means fewer chances of costly holders being dropped and damaged.

ThermoGrip® Machine: ISG3430TWK-11-WS

This processor controlled ISG3430TWK-11-WS unit is simple to use. All that needs to be done is to select the tool diameter range. After the induction coil is positioned around the tool holder, push the start button and the coil heats the tool holder sufficiently. When heat cycle is completed, move the coil upward away from tool. Raise the cooling sleeve and press the cooling button, allowing the tool to cool in seconds.

ISG3430TWK-11-WS: It is a universal heat-shrinking unit for the professional use of heat-shrinking technology. With its unique coil changing system, the power transfer adjusted to different clamping chucks is guaranteed within a short period of time. Compared to other systems, this makes it possible to clamp the smallest diameter tools. This allows for a constant preparation of a high number of tools. Guaranteed.

ThermoGrip® Machine: ISG3430TWK-11-WS			
Catalog No.	ISG3430TWK-11-WS	Max Tool Length	400mm 15.75”
Dimensions D x W x H	800mm x 560mm x 950mm 31.5” x 22” x 38”	Max Cooling Length	160mm 6.3”
Clamping Range SC	6-32mm 1/8”-1-1/4”	Cooling Type	Liquid/ emulsion
Clamping Range HSS	6-32mm 1/4”-1-1/4”	Cooling Time	20 Seconds
Coil	Quick Change	Geometry Independent Cooling	Yes
Electric Current Supply	3x480V-16A	Max Machine Interface	HSK 100 CAT50
Power kW	11 kW	Required Accessories	setting pot
Weight	115 lbs	Optional Accessories	setting pot

The Basics of Turning, Turning Edition

■ Calculating Cutting Speed

(1) Calculating rotation speed from cutting speed

$$n = \frac{1{,}000 \times v_c}{\times D_m}$$

n : Spindle Speed (min^{-1})
v_c : Cutting speed (m/min)
D_m : Inner/outer diameter of workpiece (mm)
: $\pi \approx 3.14$

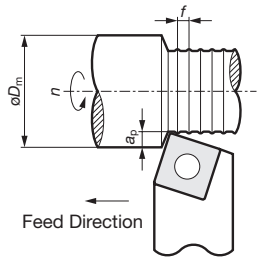
Example: v_c=150m/min, D_m=100mm

$$n = \frac{1{,}000 \times 150}{3.14 \times 100} = 478\ (min^{-1})$$

(2) Calculating cutting speed from rotational speed

$$v_c = \frac{\times D_m \times n}{1{,}000}$$

Refer to the above table



- n : Spindle speed (min^{-1})
- v_c : Cutting speed (m/min)
- f : Feed rate per revolution (mm/rev)
- a_p : Depth of cut (mm)
- D_m : Diameter of workpiece (mm)

■ Calculating Power Requirements

$$P_c = \frac{v_c \times f \times a_p \times k_c}{60 \times 10^3 \times}$$

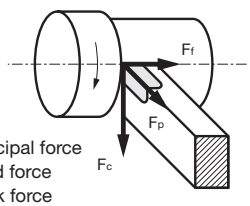
$$H = \frac{P_c}{0.75}$$

P_c : Power requirements (kW)
v_c : Cutting speed (m/min)
f : Feed Rate (mm/rev)
a_p : Depth of cut (mm)
k_c : Specific cutting force (MPa)
H : Required horsepower (HP)
: Machine efficiency (0.70 to 0.85)

● Rough value of kc

Aluminum: 800MPa
General steel: 2,500 to 3,000MPa
Cast iron: 1,500MPa

■ Three cutting force components



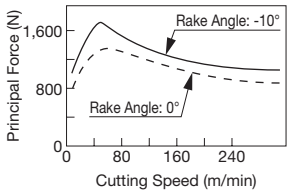
F_c : Principal force
F_f : Feed force
F_p : Back force

● Calculating cutting force

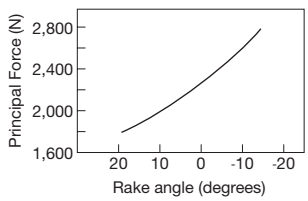
$$P = \frac{k_c \times q}{1{,}000} = \frac{k_c \times a_p \times f}{1{,}000}$$

P : Cutting force (kN)
k_c : Specific cutting force (MPa)
q : Chip area (mm^2)
a_p : Depth of Cut (mm)
f : Feed Rate (mm/rev)

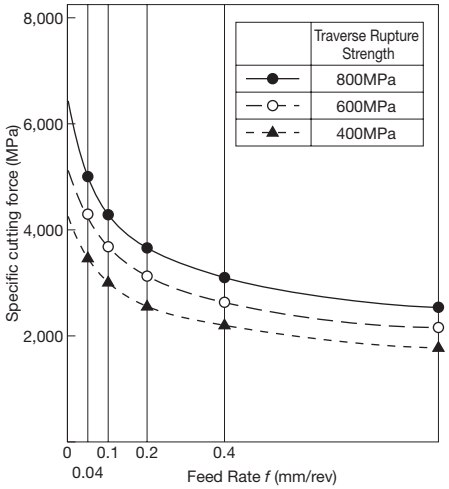
■ Relation between cutting speed and cutting force



■ Relation between rake angle and cutting force



■ Relation between feed rate and specific cutting force (for carbon steel)



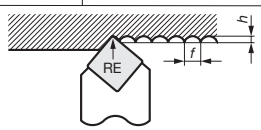
When feed rate decreases, specific cutting force increases.

■ Machined Surface Roughness

● Theoretical (geometrical) surface roughness

$$h = \frac{f^2}{8 \times RE} \times 10^3$$

h: Theoretical surface roughness (μm)
f : Feed rate per revolution (mm/rev)
RE: Nose radius (mm)



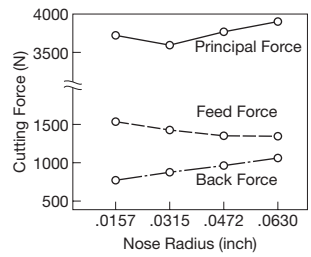
■ Actual surface roughness

Steel:
Theoretical surface roughness × 1.5 to 3
Cast iron:
Theoretical roughness × 3 to 5

● Ways to improve surface finish roughness

(1) Use an insert with a larger nose radius
(2) Optimise the cutting speed and feed rate so that built-up edges do not occur
(3) Select an appropriate insert grade
(4) Use wiper insert

■ Relation between nose radius and 3-part force

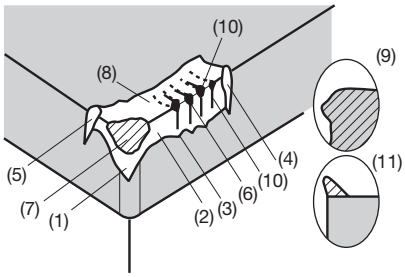


Large nose radius increases back force.

Part Material: Alloy Steel (38HS)
Insert: TNGA43○○
Holder: PTGNR2525-43
Cutting Conditions: v_c =330 SFM,
a_p =.157",
f =0.018 IPR

Forms of Tool Failure and Tool Life, Turning Edition

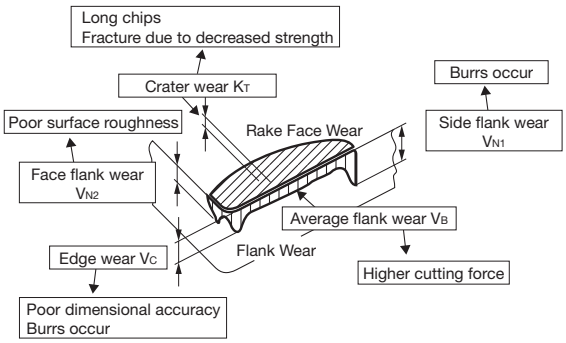
■ Forms of Tool Failure



Classification	No.	Name of Failure	Major Causes of Failure
Failure Caused by Mechanical Factors	(1) to (5)	Flank Wear	Wear caused by the scratching effect of hard grains contained in the work material
	(6)	Chipping	Fine breakages caused by high cutting loads or vibration
	(7)	Fracture	Large breakage caused by the impact of an excessive mechanical force acting on the cutting edge
Failure Caused by Thermal and Chemical Reactions	(8)	Crater wear	Cutting chips removing tool material as it flows over its top rake at high temperatures
	(9)	Plastic deformation	Deformation of cutting edge due to softening at high temperatures
	(10)	Thermal cracking	Fatigue from rapid, repeated heating and cooling cycles during interrupted cutting
	(11)	Built-up edges	Work material is pressure welded on the top face of the cutting edge

■ Tool Wear Curve

Forms of Tool Wear



Flank wear	Crater wear on rake face
	· Wear increases rapidly right after starting cutting, then moderately and proportionally, and then rapidly again after a certain value	· Wear increases proportionately to the cutting time

■ Tool Life (V-T)

· This double logarithm graph shows the relative tool life (T) with the specified wear over a range of cutting speeds (Vc) on the X axis, and the cutting speed along the Y axis

	Flank Wear	Crater wear
Tool wear		Tool life		
Cutting Edge Failure and Countermeasures, Turning Edition

■ Insert Failure and Countermeasures

Insert Failure	Cause	Countermeasures
Flank Wear	· Tool grade lacks wear resistance · Cutting speed is too fast · Feed rate is far too slow	· Select a more wear-resistant grade P30→P20→P10 K20→K10→K01 · Increase rake angle · Decrease cutting speed · Increase feed rate
Crater Wear	· Tool grade lacks crater wear resistance · Rake angle is too small · Cutting speed is too fast · Feed rate and depth of cut are too large	· Select a more crater wear-resistant grade · Increase rake angle · Change the chipbreaker of the insert · Decrease cutting speed · Reduce feed rate and depth of cut
Cutting Edge Chipping	· Tool grade lacks toughness · Cutting edge breaks off due to chip adhesion · Cutting edge is not strong enough · Feed rate and depth of cut are too large	· Select a tougher grade P10→P20→P30 K01→K10→K20 · Increase amount of honing on cutting edge · Reduce rake angle · Reduce feed rate and depth of cut
Cutting Edge Fracture	· Tool grade lacks toughness · Cutting edge is not strong enough · Holder is not strong enough · Feed rate and depth of cut are too large	· Select a tougher grade P10→P20→P30 K01→K10→K20 · Select an insert chipbreaker with a strong cutting edge · Select a holder with a larger approach angle · Select a holder with a larger shank size · Reduce feed rate and depth of cut
Adhesion/Built-up Edges	· Inappropriate grade selection · Cutting edge is not sharp enough · Cutting speed is too slow · Feed rate is too slow	· Select a grade with less affinity to the work material Coated carbide or cermet grades · Select a grade with a smooth coating · Increase rake angle · Reduce honing · Increase cutting speed · Increase feed rate
Plastic Deformation	· Tool grade lacks thermal resistance · Cutting speed is too fast · Feed rate and depth of cut are too large · Not enough coolant	· Select a more crater wear-resistant grade · Increase rake angle · Decrease cutting speed · Reduce feed rate and depth of cut · Supply sufficient coolant
Notch Wear 	· Tool grade lacks wear resistance · Rake angle is too small · Cutting speed is too fast	· Select a more wear-resistant grade P30→P20→P10 K20→K10→K01 · Increase rake angle · Alter depth of cut to shift the notch location

Chip Control and Countermeasures, Turning Edition

■ Type of Chip Generation

	Flowing	Shearing	Tearing	Cracking
Type				
Condition	Continuous chips with good surface finish	Chip is sheared and separated by the shear angle	Chips appear to be torn from the surface	Chips crack before reaching the cutting point
Application	General cutting of steel and light alloy	Steel, stainless steel (low speed)	Steel, cast iron (very low speed, very small feed rate)	Cutting of general cast iron and carbon
Influence factor	Large ← Deformation of work material → Small Large ← Rake angle → Small Small ← Depth of cut → Large Large ← Cutting speed → Small			

■ Type of Chip Control

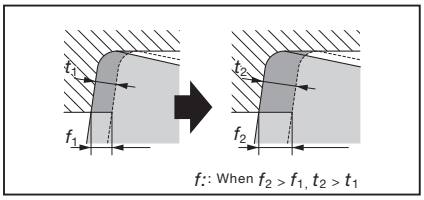
	Depth of cut	A	B	C	D	E
Classification of chip shapes	Large					
	Small					
Evaluation	NC lathe (for automation)	×	×	○	○	△
	General-purpose lathe (for safety)	×	○	○	○ to △	×

Good: C type, D type

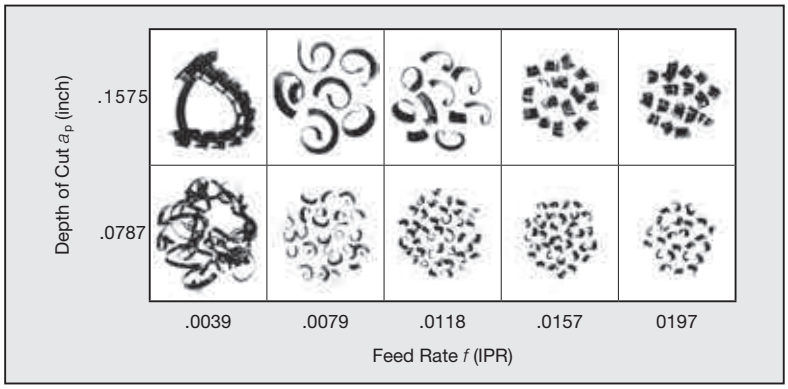
Poor
- A type: Twines around the tool or workpiece, damaging the machined surface and affecting safety
- B type: Causes problems in the automatic chip conveyor and chipping occurs easily
- E type: Causes spraying of chips and poor surface finish due to chattering, along with chipping, large cutting force and high temperatures

■ Factor of Improvement of Chip Control

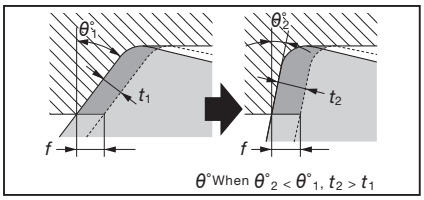
(1) Increase feed rate (f)



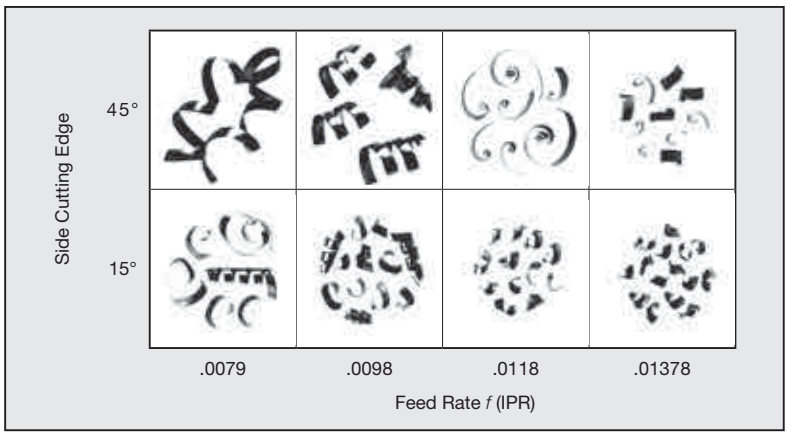
When the feed rate increases, the chip thickness (t) increases and chip control improves.



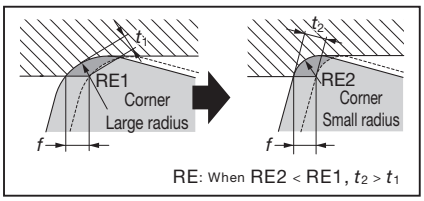
(2) Decrease side cutting edge (θ°)



Even if the feed rate is the same, a smaller side cutting edge angle makes chips thicker and chip control improves.



(3) Reduce nose radius (RE)



Even if the feed rate is the same, a smaller nose radius makes chips thicker and chip control improves.

* Cutting force increases proportionately to the length of the contact surface. Therefore, a larger nose radius increases back force which induces chattering. A smaller nose radius produces a rougher surface finish at the same feed rate.

The Basics of Threading, Turning Edition

■ Thread Cutting Methods

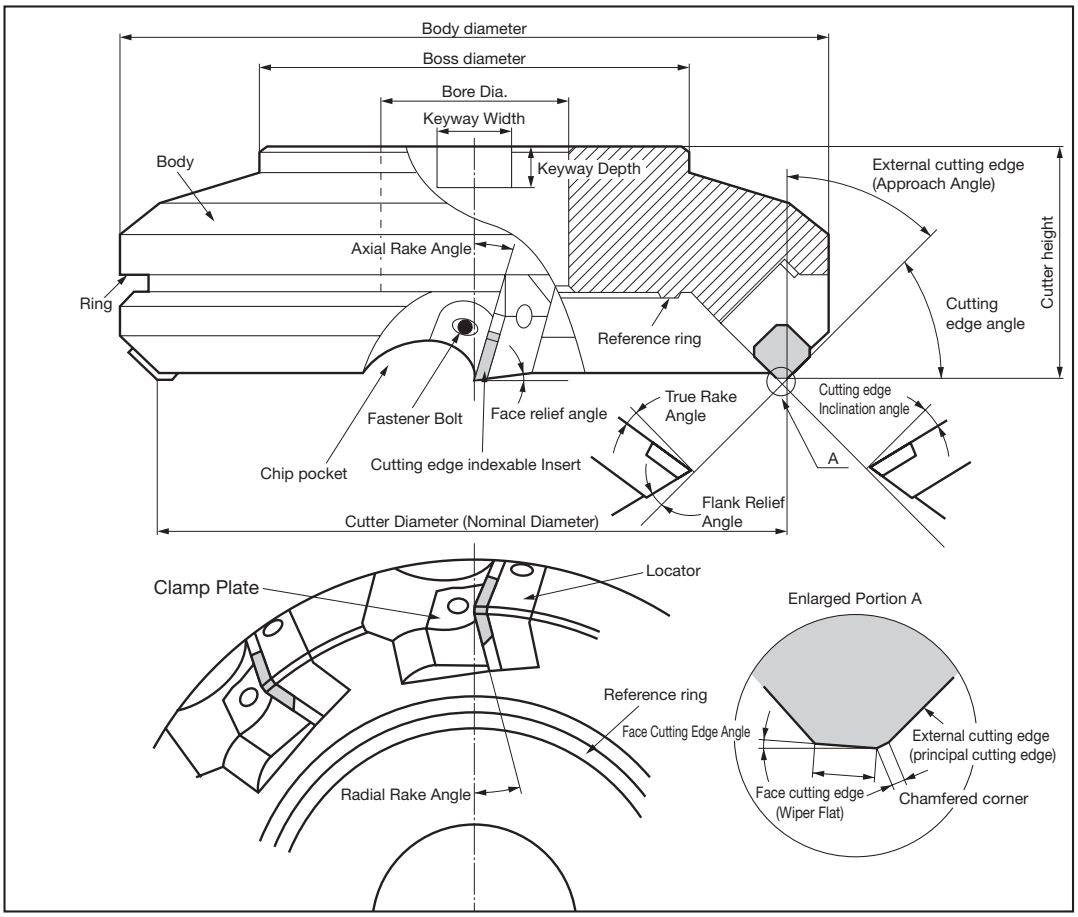
Cutting Method	Features
Radial Infeed 	· Most common threading technique, used mainly for small pitch threads. · Easy to change cutting conditions such as depth of cut, etc. · Long contact point has a tendency to chatter. · Chip control is difficult. · Considerable damage tends to occur on the trailing edge side.
Flank Infeed 	· Effective for large-pitch threads and blemish-prone work material surfaces. · Chips evacuate from one side for good chip control. · The trailing edge side is worn, and therefore the flank is easily worn.
Modified Flank Infeed 	· Effective for large-pitch threads and blemish-prone work material surfaces. · Chips evacuate from one side for good chip control. · Inhibits flank wear on trailing edge side.
Alternating Flank Infeed	· Effective for large-pitch threads and blemish-prone work material surfaces. · Wears evenly on right and left cut edges. · Since both edges are used alternately, chip control is sometimes difficult.

■ Troubleshooting for Threading

	Failure	Cause	Countermeasures
Cutting Edge Damage	Excessive Wear	· Tool grade	· Select a more wear-resistant grade
		· Cutting conditions	· Reduce cutting speed · Use a suitable quantity and concentration of coolant · Change the number of passes
	Uneven Wear on Right and Left Sides	· Tool mounting	· Check whether the cutting edge inclination angle is appropriate for the thread lead angle · Check whether the tool is mounted properly
		· Cutting conditions	· Change to modified flank infeed or alternating flank infeed
	Chipping	· Cutting conditions	· If built-up edge occurs, increase the cutting speed
	Breakage	· Biting of chips	· Supply enough coolant to the cutting edge
		· Cutting conditions	· Increase the number of passes and reduce the depth of cut for each pass · Use separate tools for roughing and finishing
Shape and Accuracy	Poor Surface Roughness	· Cutting conditions	· If blemished due to low-speed machining, increase the cutting speed · If chattering occurs, decrease the cutting speed · If the depth of cut of the final pass is too small, make it larger
		· Tool grade	· Select a more wear-resistant grade
		· Inappropriate cutting edge inclination angle	· Select the correct shim to ensure relief on the side of the insert
	Inappropriate Thread Shape	· Tool mounting	· Check whether the tool is mounted properly
	Shallow Thread Depth	· Shallow depth of cut	· Check the depth of cut
		· Tool wear	· Check damage to the cutting edge

The Basics of Milling

■ Parts



■ Milling Calculation Formulas

● Calculating Cutting Speed (Inch)

$SFM = 0.262 \times DC \times n$

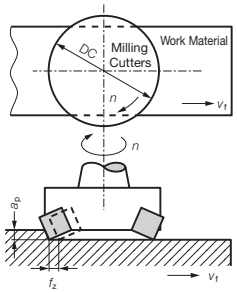
$$n = \frac{3.82 \times SFM}{DC}$$

● Calculating Feed Rate (Inch)

$v_f = IPR \times n$

$$IPR = \frac{v_f}{n}$$

v_c : Cutting speed (SFM)
π : $\pi \approx 3.14$
DC : Nominal cutting diameter (inch)
n : Rotation speed (min^{-1}) (RPM)
v_f : Feed rate per minute (inch/min)
f_z : Feed rate per tooth (inch/t)



● Calculating power requirements

$$P_c = \frac{a_e \times a_p \times v_f \times k_c}{60 \times 10^6 \times \eta} = \frac{Q \times k_c}{60 \times 10^3 \times \eta}$$

● Horsepower requirements

$$H = \frac{P_c}{0.75}$$

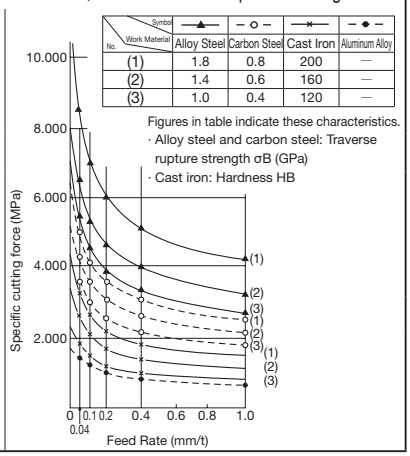
● Chip evacuation amount

$$Q = \frac{a_e \times a_p \times v_f}{1{,}000}$$

P_c: Power consumption (kw)
H : Required horsepower (HP)
Q : Chip evacuation amount (cm^3/min)
a_e: Cutting width (mm)
v_f : Feed rate per minute (mm/min)
a_p: Depth of cut (mm)
k_c : Cutting force (MPa)
Rough values (Steel: 2,500 to 3,000MPa / Cast iron: 1,500MPa / Aluminum: 800MPa)
η : Machine efficiency (about 0.75)

● Relation between feed rate, work material and specific cutting force

No. \ Work Material	Alloy Steel	Carbon Steel	Cast Iron	Aluminum Alloy
(1)	1.8	0.8	200	—
(2)	1.4	0.6	160	—
(3)	1.0	0.4	120	—

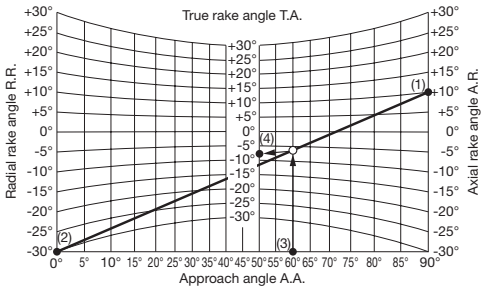


The Basics of Milling

■ Functions of cutting edge angles

	Material	Symbol	Function	Effect
(1) (2)	Axial rake angle Radial rake angle	A.R. R.R.	Determines chip evacuation direction, adhesion, thrust, etc.	Available in positive to negative (large to small) rake angles. Typical combinations: Positive and Negative, Positive and Positive, Negative and Negative
(3)	Approach angle	A.A.	Determines chip thickness and chip evacuation direction	Large: Thin chips Small cutting force
(4)	True rake angle	T.A.	Effective rake angle	Positive (Large): Excellent machinability and low chip adhesion. Low cutting edge strength Negative (Small): Strong cutting edge and easy chip adhesion
(5)	Cutting edge inclination angle	I.A.	Determines chip control direction	Positive (Large): Excellent chip control and small cutting force. Low cutting edge strength
(6)	Face cutting edge angle	F.A.	Determines surface finish roughness	Small: Excellent surface roughness
(7)	Relief angle		Determines cutting edge strength, tool life, chattering	

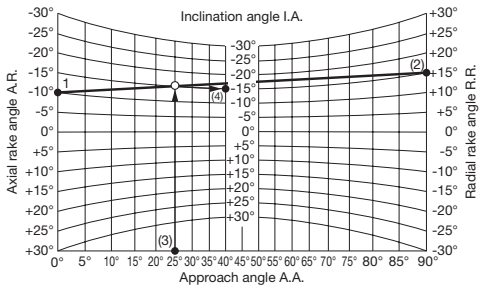
True rake angle (T.A.) table



Example: (1) A.R. (Axial rake angle) = +10°
(2) R.R. (Radial rake angle) = -30°
(3) A.A. (Approach angle) = 60°
-> (4) T.A. (True rake angle) = -8°

Formula: tan T.A.=tan R.R./cos A.A. + tan A.R./sin A.A.

Inclination angle (I.A.) chart



Example: (1) A.R. (Axial rake angle) = -10°
(2) R.R. (Radial rake angle) = +15°
(3) A.A. (Approach angle) = 25°
-> (4) I (inclination angle) = -15°

Formula: tan I.R.=tan A.R./cos A.A. - tan R.R./sin A.A.

■ Rake angle combination and features

	Double Positive type	Negative - Positive type	Double Negative type
Edge combination and chip evacuation A.R.: Axial rake angle R.R : Radial rake angle A.A.: Approach angle : Chip and evacuation direction : Cutter rotation direction			Advantages	Good sharpness	Excellent chip evacuation and sharpness	Economical design enabling use of both sides of insert Strong cutting edge
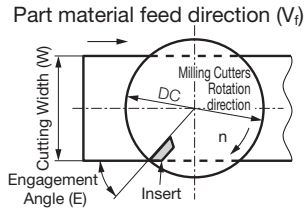
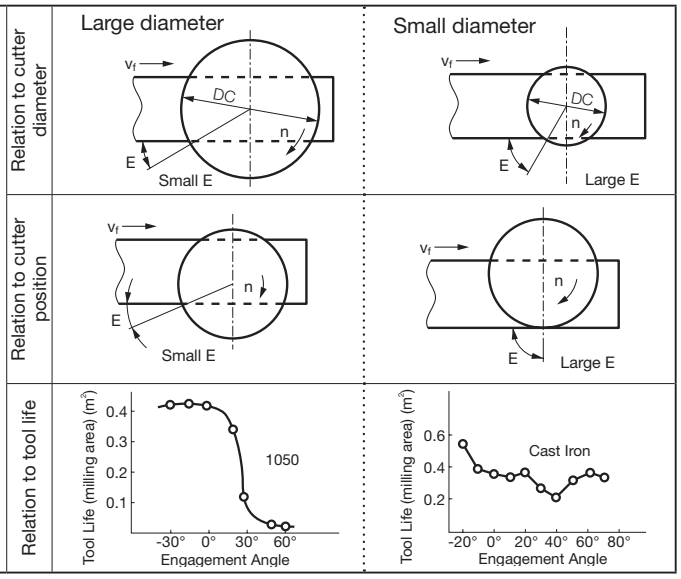
Disadvantages	Only single-sided inserts with a lower cutting edge strength can be used	Only single-sided inserts can be used	Dull cutting action
Applications	Machining of aluminum alloy and other materials requiring sharpness	Machining of steel, cast iron, and stainless steel, with suitable strength and good evacuation	For hard materials such as cast iron or poor surfaces such as castings
Cat. No.	ALNEX, HF, WAX	WGX, WFX, RSX, WEZ	TSX, DGC, DFC, DNX
Chips (Ex.) Part material: Alloy Steel · v_c=430 SFM f_z =.009 in./t a_p=.118”			

■ Relation between engagement angle and tool life



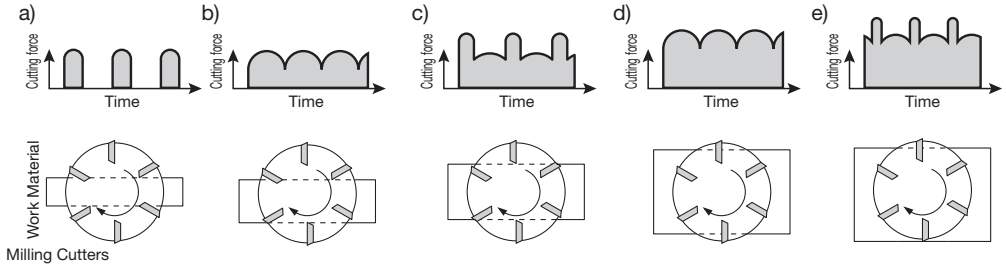
The engagement angle denotes the angle at which the full length of the cutting edge comes in contact with the work material, with reference to the feed direction.

· The larger E is, the shorter the tool life
· To change the value of E:
(1) Increase the cutter size
(2) Shift the position of the cutter



● Relation between the number of simultaneously engaged cutting edges and cutting force

Normally, a cutting width 70 to 80% of the cutter diameter is considered appropriate, as shown in example d). However, this may not apply due to the actual rigidity of the machine or workpiece, and the machine horsepower.



· 0 or 1 edge in contact at same time
· Only 1 edge in contact at any time
· 1 or 2 edges in contact
· 2 edges in contact at any time
· 2 to 3 edges in contact

■ Improving surface roughness

(1) Inserts with wiper flat

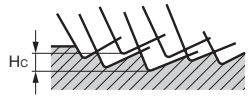
When all of the cutting edges have wiper flats, a few teeth protrude due to inevitable runout and act as wiper inserts.

· Insert equipped with straight wiper flat
(Face angle: Around 15' to1°)
· Insert equipped with curved wiper flat
(Curvature: ≈ R500 (example))

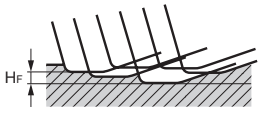
(2) Wiper insert assembling system

A system in which one or two inserts (wiper inserts) protrude with a smooth curved edge just a little beyond the other teeth to wipe the milled surface. (Applicable to WGX Type, DGC Type, etc.)

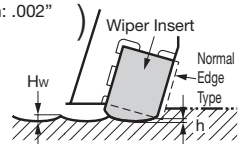
● Surface roughness without wiper flat



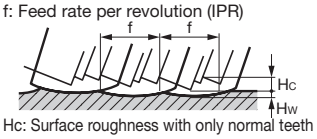
● Surface roughness with straight wiper flat



h: Projection value of wiper insert
(Cast Iron: .002"
Al: .001")

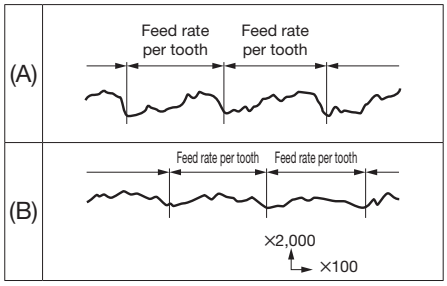


f: Feed rate per revolution (IPR)



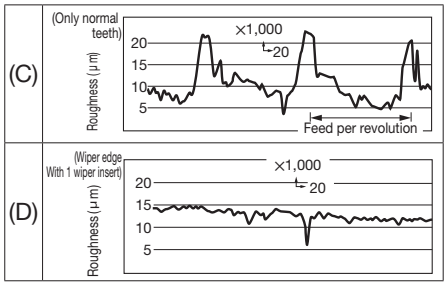
Hc: Surface roughness with only normal teeth
Hw: Surface roughness with wiper insert

● Surface roughness with wiper edge (difference in face cutting edge)



· Part material: Alloy Steel
· Cutter: DPG5160R (per tooth)
· v_c = 510 SFM
f_z = .0092 in./t
a_p = .0787"
· Face Cutting Edge Angle
(A): 28'
(B): 6'

● Effects of wiper insert (example)



· Part material: Grey Cast Iron
· Cutter: DPG4100R
· Insert: SPCH42R
· Face runout: .0006"
· Runout: .0016"
v_c = 350 SFM
f_z = .0571 IPR
(C): Normal teeth
(D): Per wiper edge

Troubleshooting for Milling

■Troubleshooting for Milling

	Failure	Basic Remedies		Countermeasure Examples
Cutting Edge Damage	Excessive Flank Wear 	Tool Grade Cutting Conditions	· Select a more wear-resistant grade Carbide (P30→P20, K20→K10) → {Coated, Cermet} · Decrease the cutting speed · Increase feed rate	· Recommended Insert Grade Steel: Finishing — T250A, T4500A (Cermet); Roughing — ACP100 (Coated) ACP2000 Cast Iron: Finishing — ACK100 (Coated) BN7000 (SUMIBORON); Roughing — ACK200 (Coated) ACK2000 Non-Ferrous Alloy: Finishing — DA1000 (SUMIDIA); Roughing — DL1000 (Coated)
	Excessive Crater Wear 	Tool Grade Tool Design Cutting Conditions	· Select a crater-resistant grade · Use a sharp chipbreaker (G → L) · Decrease the cutting speed · Reduce depth of cut and feed rate	· Recommended Insert Grade Steel: Finishing — T250A, T4500A (Cermet); Roughing — ACP100 (Coated) Cast Iron: Finishing — ACK100 (Coated); Roughing — ACK200 (Coated) Non-Ferrous Alloy: Finishing — DA1000 (SUMIDIA); Roughing — DL1000 (Coated)
	Chipping 	Tool Grade Tool Design Cutting Conditions	· Use a tougher grade P10→P20→P30 K01→K10→K20 · Select a negative/positive cutter with a large peripheral cutting edge angle (a small approach angle). · Reinforce the cutting edge (honing) · Change chipbreaker (G → H) · Reduce feed rate	· Recommended Insert Grade Steel: Finishing — ACP200 (Coated); Roughing — ACP300 (Coated) Cast Iron: Finishing — ACK200 (Coated); Roughing — ACK300 (Coated) · Recommended cutter: WaveMill WGX Type · Cutting conditions: Refer to H20
	Breakage 	Tool Grade Tool Design Cutting Conditions	· If it is due to excessive low speeds or very low feed rates, select a grade resistant to chip adhesion · If the cause is thermal cracking, select a thermal impact resistant grade · Select a negative/positive (or double negative) cutter type with a large peripheral cutting edge angle (a small approach angle) · Reinforce the cutting edge (honing) · Change chipbreaker (G →→ H) · Increase insert size (thickness in particular) · Select appropriate conditions for that particular application	· Recommended Insert Grade Steel: Roughing — ACP300 (Coated) ACP3000 Cast Iron: Roughing — ACK300 (Coated) ACU2500 · Recommended cutter: WaveMill WGX Type · Insert thickness: .125 → .187” · Change chipbreaker: Standard → Strong edge type · Cutting conditions: Refer to H20
Others	Unsatisfactory Machined Surface Finish	Tool Grade Tool Design Cutting Conditions	· Select an adhesion-resistant grade Carbide → Cermet · Improve axial runout of cutting edges (Use a cutter with less runout / Mount the correct insert) · Use a wiper insert · Use cutters dedicated for finishing · Increase the cutting speed	· Recommended Cutters and Insert Grades Steel: General-purpose Cutter Insert — WGX Type* ACP200 (Coated); Finishing Cutter Insert — WGX Type T4500A (Cermet) Cast Iron: General-purpose Cutter Insert — DGC Type ACK200 (Coated); Finishing Cutter Insert — FMU Type BN7000 (SUMIBORON) Non-Ferrous Alloy: General-purpose Cutter Insert — RF type * H1 (Carbide) DL1000 (Coated Carbide); Finishing Cutter Insert — RF Type DA1000 (SUMIDIA) Cutters marked with * can be mounted with wiper inserts.
	Chattering	Tool Design Cutting Conditions Others	· Select a cutter with sharp cutting edges · Use an irregular pitched cutter · Reduce the feed rate · Improve the rigidity of the workpiece and cutter clamp	· Recommended cutter For steel: WaveMill WGX Type For cast iron: Sumi Dual Mill DGC Type For light alloy: Aluminum Body Cutter RF Type
	Unsatisfactory Chip Control	Tool Design	· Select a cutter with good chip evacuation features · Reduce number of teeth · Enlarge chip pocket	· Recommended cutter: WaveMill WGX Type
	Edge Chipping On Workpiece	Tool Design Cutting Conditions	· Increase the peripheral cutting edge angle (decrease the approach angle) · Change chipbreaker (G → L) · Reduce the feed rate	· Recommended cutter: WaveMill WGX Type
	Burr formation	Tool Design Cutting Conditions	· Use a sharp cutter · Increase feed rate · Use a burr-proof insert	· Recommended cutter: WaveMill WGX Type + FG Chipbreaker Sumi Dual Mill DGC Type + FG Chipbreaker

Troubleshooting for Milling

■ Horsepower Consumption

This section contains the horsepower consumption formula and the explanation of the associated variables. A list of commonly encountered materials has been added to assist you when determining the required horsepower for a machining operation.

Machine efficiency, drive type, and amount of time that the machine has been running can effect the horsepower and torque availability at the spindle. Without an extensive list of specifications, it is nearly impossible to predict the capabilities of a machine tool. Sumitomo suggests that unless the capabilities of a machine tool are well known, it is wise to limit the attempted operations to those that require no more than 65% of the machine's rated horsepower.

Please take the time to understand the power requirements of an operation before attempting it, unless you are very familiar with the tool, material, and especially the machine being used.

*Note: If the material that you are machining is not found in this list, contact the material manufacturer for further information. Most material suppliers, or mills, have excellent technical resources available. However, if the material in question exhibits machining properties that are similar to a given material, use the corresponding "K" factor.

■ Horsepower Consumption Formula

$$\text{Horsepower} = \frac{W \times D \times F}{K}$$

W = width of cut (inches)
D = depth of cut (inches)
F = feed rate (inches/minute)
K = 'K' factor for material

'K' factors for some common materials are:

Material	'K'
Magnesium	4.0
Aluminum	4.0
Copper	2.0
Brass	2.5
Bronze	2.0
Malleable iron	1.0
Cast iron	
Ferrite	1.5
Pearlitic	1.0
Chilled	.6
Steel	
up to 150 BHN	1.0
up to 300 BHN	.8
up to 400 BHN	.5
up to 500 BHN	.4

Material	'K'
Stainless steel	
Free machining	1.0
Others	.6
Titanium	
under 100,000 psi	.8
100,000-135,000 psi	.6
135,000 psi and over	.4
High-tensile alloys	
180,000-220,000 psi	.5
220,000-260,000 psi	.4
260,000-300,000 psi	.3
High-temperature alloys	
Nickel base alloys	.4
Cobalt base alloys	.4
Austenitic alloys	.4

■ Lead Angle Effect

The lead angle effect is a commonly known phenomenon in tool design. As the lead angle of a tool (the angle at which the insert is rotated away from its axial center line) increases, the actual thickness of the produced chip decreases from the programmed amount. This allows us to take advantage of increased feed rates over standard zero degree (90 degree shoulder) lead tools.

By comparing the following lead angle figures, it is possible to increase the actual feed rate up to 30% over the suggested numbers (depending on the type of tool), thus increasing productivity.

Tool Lead Angle	% of chip thickness from programmed feed rate
15 degrees	96%
20 degrees	94%
30 degrees	86%
45 degrees	71%

To simplify this calculation we have included a chart that allows easy determination of programmed feed per tooth by choosing desired feed per tooth and then following the column down to the row that matches the lead angle of the tool that is being used.

Example: Find the programmed feed per tooth for a UFO cutter (45 degree lead angle), when the desired feed per tooth is 0.006 IPT.

Answer: Programmed feed per tooth = 0.0085 IPT

■ Programmed Feed Per Tooth vs. Desired Feed Per Tooth

Tool Lead Angle	Desired Feed Per Tooth (IPT)								
	0.004	0.005	0.006	0.007	0.008	0.009	0.010	0.011	0.012
	Programmed Feed Per Tooth (IPT)								
15	0.0042	0.0052	0.0063	0.0073	0.0083	0.0094	0.0104	0.0115	0.0125
20	0.0043	0.0053	0.0064	0.0074	0.0085	0.0096	0.0106	0.0117	0.0128
30	0.0047	0.0061	0.0070	0.0081	0.0093	0.0105	0.0116	0.0128	0.0140
45	0.0057	0.0075	0.0085	0.0099	0.0113	0.0127	0.0141	0.0156	0.0170

nRadial Chip Thinning

Just as the axial rake of a cutting tool can alter the actual chip thickness, so can radial chip thinning. This occurs whenever the radial width of cut is less than 1/2 the cutter diameter. This is commonly found when making periphery cuts while end milling.

Since both tool life and productivity rely on maintaining full chip thickness, it is important to compensate for this scenario. Rather than using the mathematical process to arrive at a programmed feed rate, we have included the following chart.

To use this chart it is necessary to have the following information:

1) Desired feed per tooth (as taken from the end mill speed and feed section)
2) Cutter diameter
3) Radial width of cut

The first step is to divide the radial width of cut by the cutter diameter and find the closest value in the first column on the left. Next find the desired feed per tooth at the top of the chart and follow that column down to the row that was found in the first step. This will be the programmed feed per tooth.

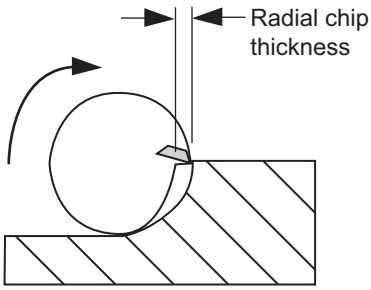
Example: 1.00″ diameter end mill
0.020″ radial width of cut
0.004″ desired feed per tooth

Answer: Dividing 0.020″ by 1.00″=0.020

Finding 0.020 in the first column on the left, and then the 0.004″ desired feed per tooth at the top, we find where the two meet and obtain 0.014″ programmed feed per tooth.

This results in a large increase in the feed rate. If we use these factors for a four flute tool at 2292 RPM, we have a feed rate of 128 IPM (2292 RPM x 0.014 IPT x 4 Flutes) versus 37 IPM (2292 RPM x 0.004 IPT x 4 Flutes) that might have otherwise been programmed.

As you can see from the illustration below, as radial depth increases, so does chip thickness until we reach 50% of the cutting diameter. At this point we have full, programmed chip load.



■ Radial Chip Thinning Compensation

	Desired Feed Per Tooth (IPT)								
	0.004	0.005	0.006	0.007	0.008	0.009	0.010	0.011	0.012

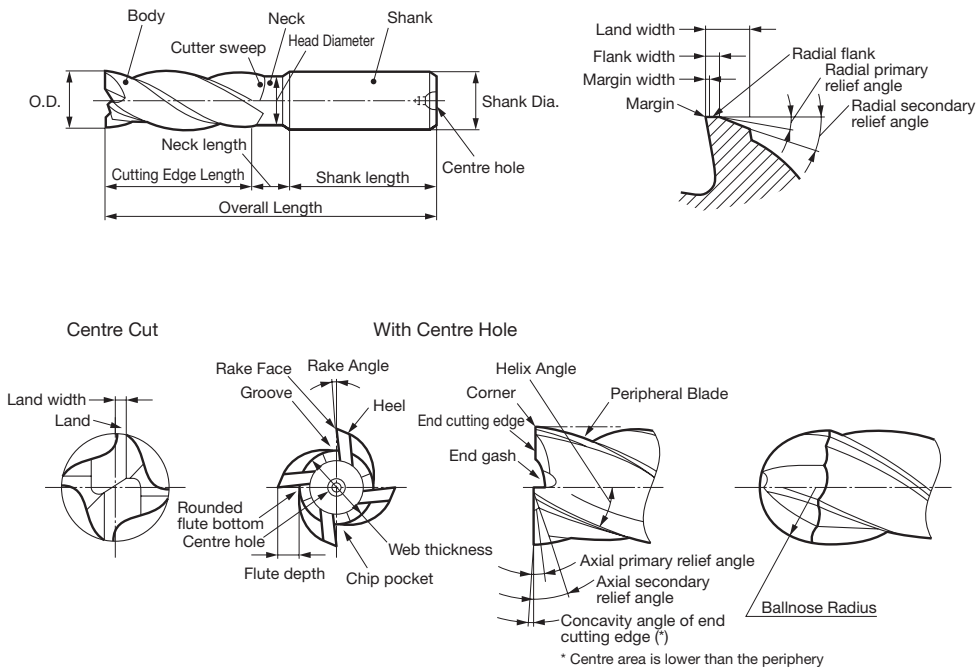
The Basics of Endmilling, Endmilling Edition

■ Parts



■ Calculating cutting conditions (square endmill)

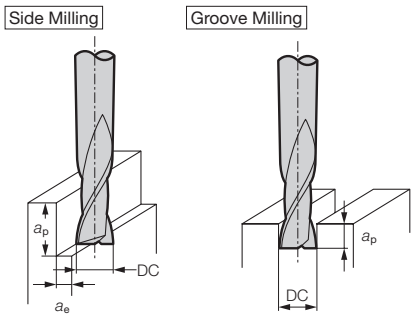
● Calculating cutting speed

$$v_c = \frac{\pi \times DC \times n}{1{,}000} \qquad n = \frac{1{,}000 \times v_c}{\pi \times DC}$$

● Calculating feed rate per revolution and per tooth

$$v_f = n \times f \qquad f = \frac{v_f}{n}$$

$$v_f = n \times f_z \times z \qquad f_z = \frac{f}{z} = \frac{v_f}{n \times z}$$

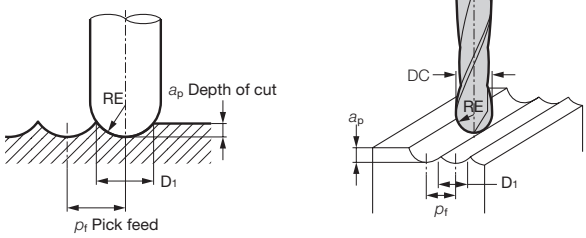


(Ballnose Endmill)

● Calculating notch width (D_1)

$$D_1 = 2 \times \sqrt{2 \times RE \times a_p - a_p^2}$$

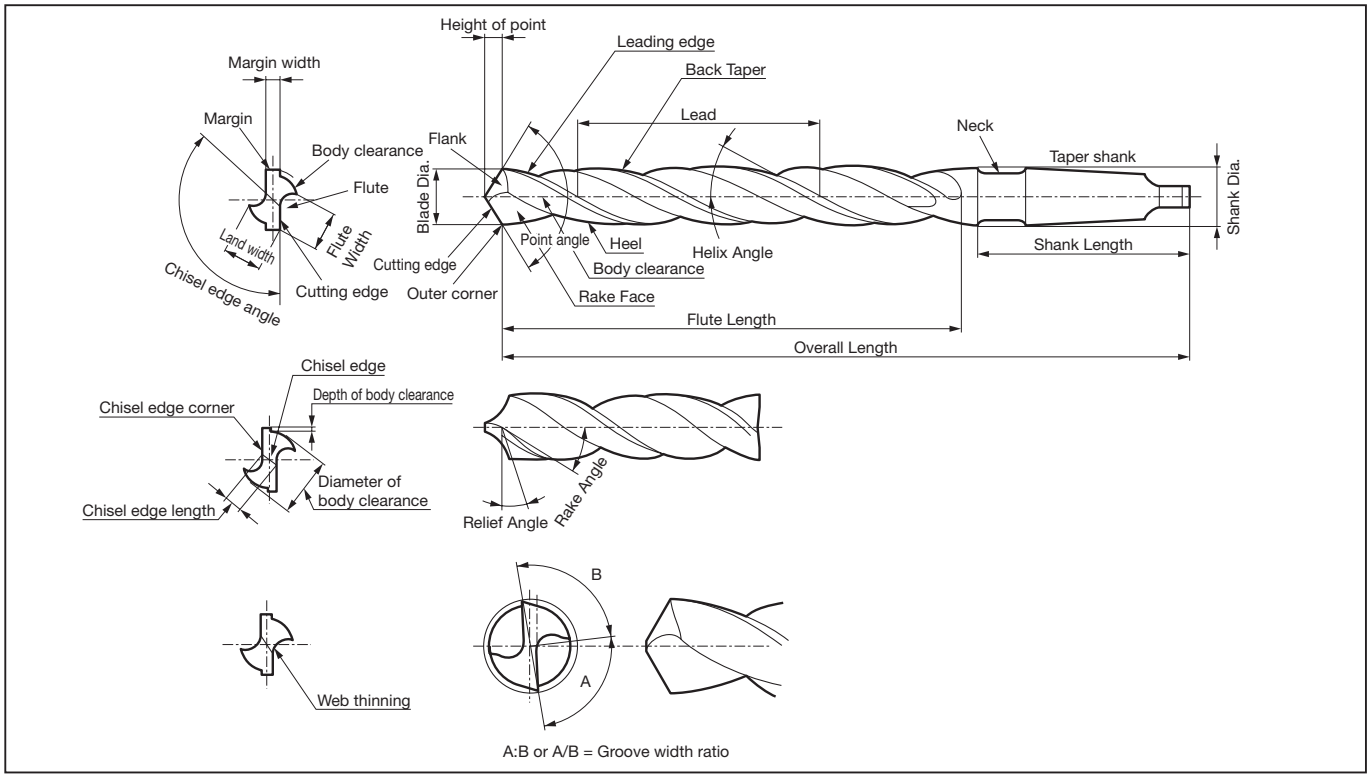
●Cutting speed and feed rate (per revolution and per tooth) are calculated using the same formula as the square endmill.



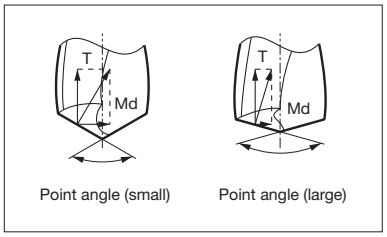
v_c	: Cutting speed (m/min)
π	: π≈3.14
DC	: Endmill diameter (mm)
n	: Spindle speed (min^{-1})
v_f	: Feed rate (mm/min)
f	: Feed rate per revolution (mm/rev)
f_z	: Feed rate per tooth (mm/t)
z	: Number of teeth
a_p	: Depth of cut in axial direction (mm)
a_e	: Depth of cut in radial direction (mm)
RE	: Ballnose radius

Basics of Drilling, Drilling Edition

■ Parts of Drill

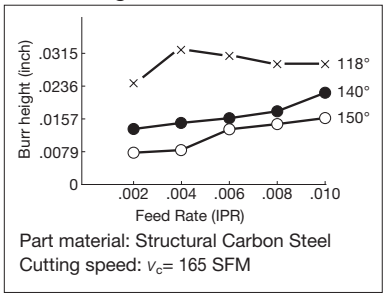


● Point angle and force



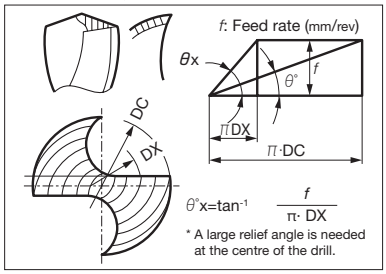
When point angle is large, thrust increases but torque decreases.

● Point angle and burr

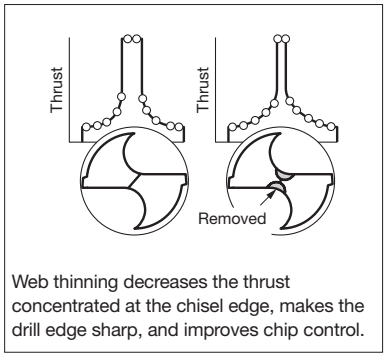


When point angle is large, burr height becomes low.

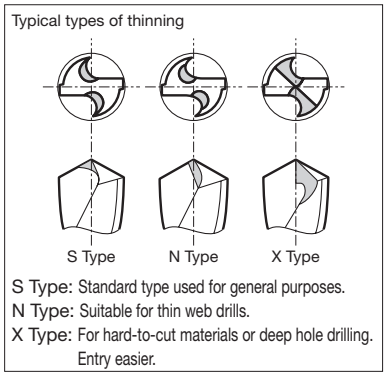
● Minimum requirement relief angle for drilling



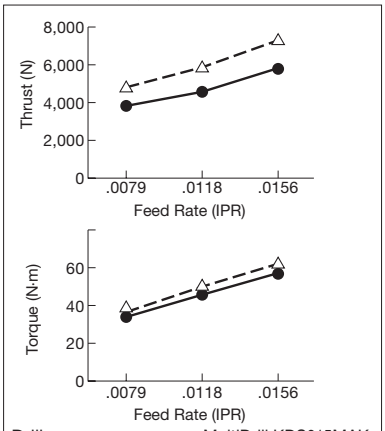
● Effects of web thinning



● Chisel width decreased by thinning

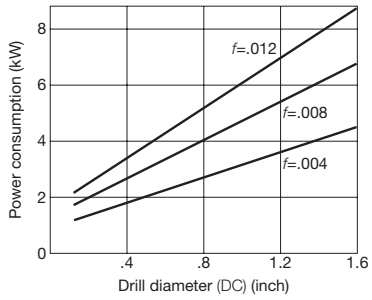


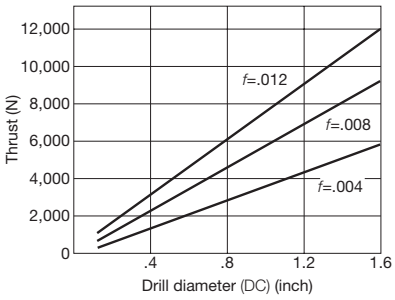
● Relation between edge treatment and cutting force



Drill : MultiDrill KDS215MAK
Edge treatment width : ●.0059”
△→.0091”
Part material : Carbon Steel (230HB)
Cutting conditions : v_c= 165 SFM, wet

■ Reference of Power Requirements and Thrust





f: Feed rate (IPR)

Part material: Medium Carbon Steel (220HB)

■ Cutting Condition Selection

- Control cutting force for low-rigidity machines

The following table shows the relation between edge treatment width and cutting force. If the cutting force is too great and causes issues, take measures such as reducing the feed rate or reducing the cutting edge treatment of the drill.

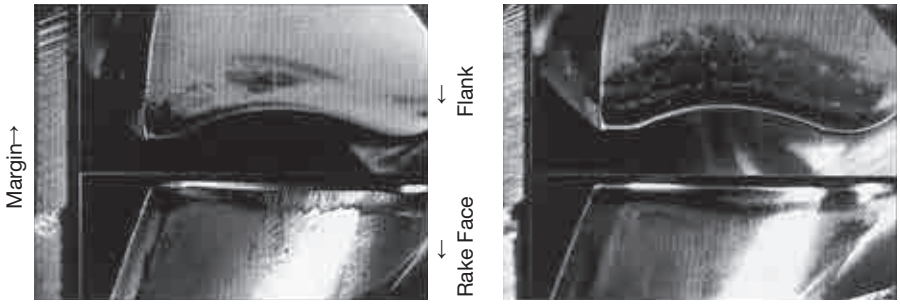
Cutting Conditions		Edge treatment width			
		.0059”		.0019”	
v_c(SFM)	*f* (IPR)	Torque (N/m)	Thrust (N)	Torque (N/m)	Thrust (N)
130	.015	12.8	2,820	12.0	2,520
165	.012	10.8	2,520	9.4	1,920
200	.009	9.2	2,320	7.6	1,640
200	.006	6.4	1,640	5.2	1,100

Drill Diameter : ø.394”
Part material : Carbon Steel (230HB)

- High speed machining recommendation

If the machine has enough power and sufficient rigidity, reasonable tool life can be ensured even when adopting higher efficiency machining; however, sufficient coolant must be supplied.

Wear example

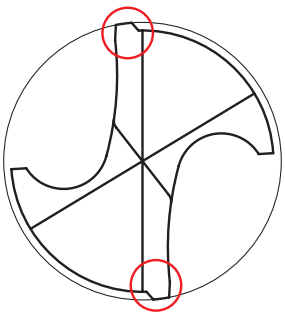


v_c= 200 SFM v_c= 400 SFM

Part material : Carbon Steel (230HB)
Cutting conditions: *f* = .0118 IPR
H=1.969”
Tool life : 600 holes (Cutting length: 1.181”)

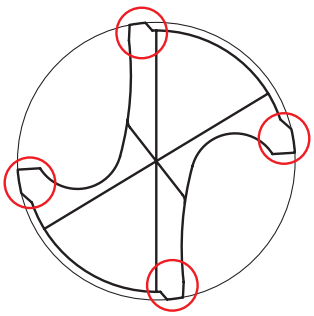
■ Explanation of Margins (Difference between single and double margins)

- Single Margin (2 guides: ○ part)



- Shape used on most drills

- Double Margin (4 guides: ○ part)

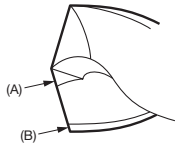


- 4-point guiding reduces hole bending and undulation for improved stability and accuracy during deep hole drilling.

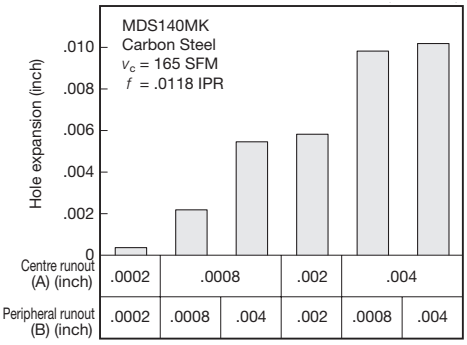
Basics of Drilling, Drilling Edition

■ Runout Accuracy

For the runout accuracy of web-thinned drills, the runout after thinning (A) is important in addition to the difference in lip height (B).



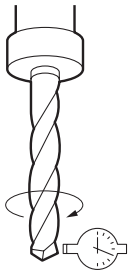
(A): Runout accuracy of thinning point
(B): The difference of the lip height



■ Drill Mounting Peripheral Runout Accuracy

• When the tool rotates

The peripheral runout accuracy of the drill mounted on the spindle should be controlled within .0012”. If the runout exceeds the limit, the drilled hole will also become large and an increase in the horizontal cutting force, which may result in drill breakage.



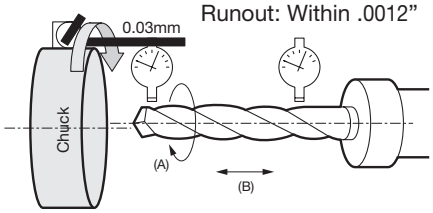
Runout: Within .0012”

Peripheral runout (inch)	Hole expansion 0 .002 (in.)	Cutting Force* 0 22 (lbs)
.0002		
.0035		

* Horizontal cutting force.
Drill: MDS120MK, part material: Carbon Steel (230HB)
Cutting Conditions: v_C= 165 SFM, f = .0118 IPR, H = 1.50”
Water-soluble Coolant

• When the part material rotates

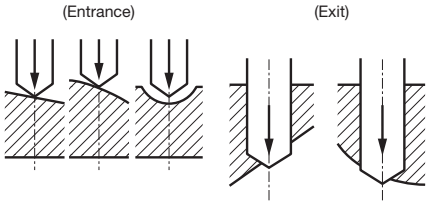
The peripheral runout at the drill edge (A) and the concentricity at (B) should be controlled within .0012”.



■ Work Material Surface and Drill Performance

• Part material with slanted or uneven surface

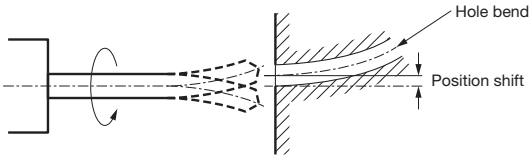
If the surface of the hole entrance or exit is slanted or uneven, decrease the feed rate to 1/3 to 1/2 of the recommended cutting conditions.



■ How to Use a Long Drill

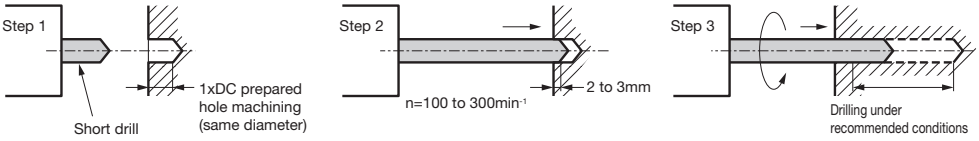
• Problem

When using a long drill (e.g. XHGS Type), SMDH-D Type drill or SMDH-12.5D Type drill at high rotation speeds, the runout of the drill tip may cause a deviation of the entry point as shown on the right, bending the drill hole and resulting in drill breakage.

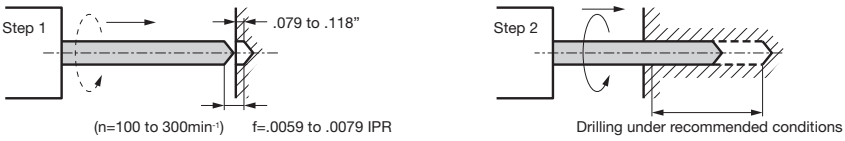


• Remedies

Method 1



Method 2 *Low rotational speed minimises centrifugal forces and prevents the drill from bending.

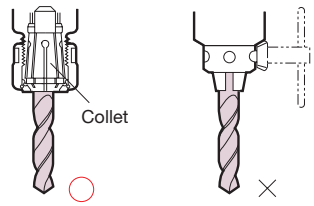


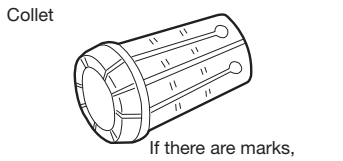
MultiDrill Usage Guidance, Drilling Edition

Drill Maintenance

(1) Collet Selection and Maintenance

- Ensure proper chucking of drills to prevent vibration. Collet type chucks are recommended, as the grip is strong and can be used with ease.
  (Drill chucks and keyless chucks are not suitable for MultiDrills as they have a weaker grip force.)
- When replacing drills, regularly remove cutting chips inside the collet by cleaning the collet and the spindle with oil. Repair marks with an oilstone.

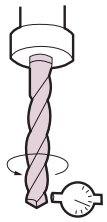




If there are marks, repair with an oilstone or change to a new one

(2) Drill Mounting

- The peripheral runout of the drill mounted on the spindle must be within 0.03mm.
- Do not chuck on the drill flute.
  (If the drill flute is inside the holder, chip evacuation will be obstructed, causing damage to the drill.)



Peripheral runout within 0.03mm

Do not grip on the drill flute

Using Cutting Oil

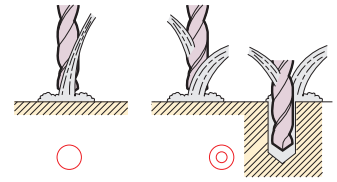
(1) Choosing Cutting Oil

- If the cutting speed is more than 131 SFM, cutting oil (JISW1 type 2) is recommended as its cooling effects and chip control capacity are good, and it is highly soluble.
- For optimum tool life at cutting speeds of less than 131 SFM, sulfo-chlorinated oil (JISA1 type 1) is recommended as it has a lubricating effect and is non-water soluble. * Insoluble cutting oil may be flammable. To prevent fire, a substantial amount of oil should be used to cool the component so that smoke and heat will not be generated.

(2) Supply of Coolant

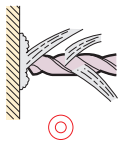
- External Coolant Supply
  There must be a sufficient external supply of coolant at the hole position.
  Coolant pressure 0.3 to 0.5MPa, coolant volume 3 to 32 SFM is a guideline.
- Internal Coolant Supply
  For holes ø4 or smaller, the oil pressure must be at least 1.5MPa to ensure a sufficient supply of coolant. For ø6 and above, if L/D is <3, the pressures should be at 0.5 to 1.0MPa. If L/D is >3, a hydraulic pressure of at least 1 to 2MPa is recommended.

- External Coolant Supply
- Vertical drilling



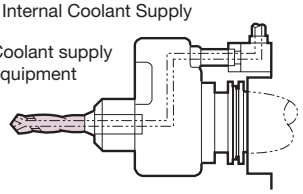
Use high pressure at entrance — Easy to use

- Horizontal drilling

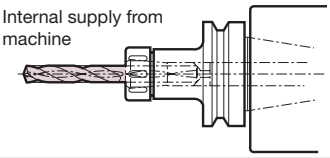


Use high pressure at entrance

- Internal Coolant Supply
- Coolant supply equipment



- Internal supply from machine

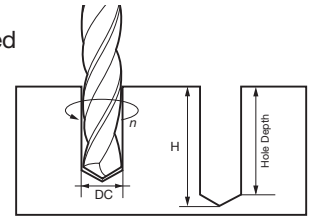


Calculation of Power Consumption and Thrust

- Calculating cutting speed

$$v_c = \frac{\times DC \times n}{1{,}000}$$

$$n = \frac{1{,}000 \times v_c}{\times DC}$$



- Calculating feed rate per revolution and per tooth

$$v_f = n \times f \qquad f = \frac{v_f}{n}$$

- Calculation of Cutting Time

$$T = \frac{H}{v_f}$$

v_c : Cutting speed (SFM)
: π≈3.14
DC : Drill diameter (in)
n : Rotation speed (min^{-1})
v_f : Feed rate (IPM)
f : Feed rate per revolution (IPR)
H : Drilling depth (in)
T : Cutting time (min)
HB : Work material Brinell hardness

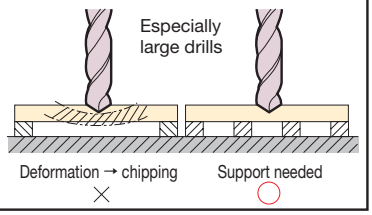
- Calculation of Power Consumption and Thrust
  <Experimental>
  Power consumption (kW) = $HB \times DC^{0.68} \times v_c^{1.27} \times f^{0.59} / 36{,}000$

  Thrust (N) = $0.24 \times HB \times DC^{0.95} \times f^{0.61} \times 9.8$

* When designing the machine, an allowance of 1.6 x power consumption and 1.4 x thrust should be given.

Clamping of the Workpiece

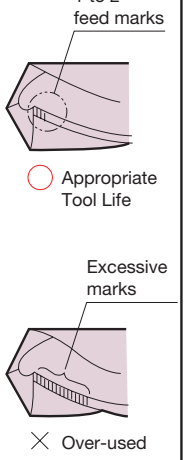
High thrust forces occur during high-efficiency drilling. Therefore, the workpiece must be supported to prevent fractures caused by deformation. Large torques and horizontal cutting forces also occur. Therefore, the workpiece must be clamped firmly enough to withstand them.



Drill Regrinding

- When to regrind
  When one or two feed marks (lines) appear on the margin, when corner wear reaches the margin width or when small chipping occurs, it indicates that the drill needs to be sent for regrinding.
- How and where to regrind
  We recommend regrinding and recoating. Regrinding alone may be sufficient, but if the work material is steel, use recoating as well as regrinding to prevent shortening of tool life. Note: Ask us or an approved vendor to recoat with our proprietary coating.
- Regrinding on your own
  Customers regrinding their own drills can obtain MultiDrill Regrinding Instructions from us directly or their vendor.

- Tool life determinant



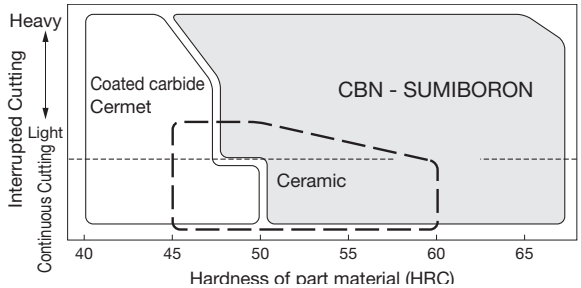
Troubleshooting for Drilling, Drilling Edition

■ Troubleshooting for Drilling

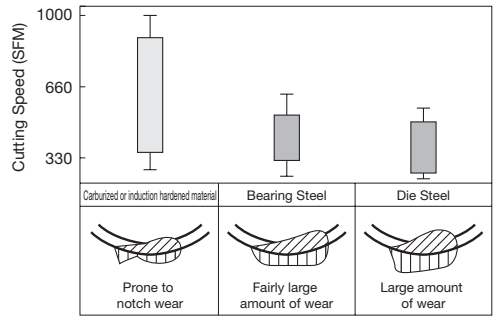
Failure		Cause	Basic Remedies	Countermeasure Examples
Drill Failure	Excessive Wear on Rake Face	· Inappropriate cutting conditions	· Use higher cutting speeds	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Increase feed rate	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Unsuitable coolant	· Reduce pressure if using internal coolant	· 1.5MPa or less (external coolant supply can be used at hole depths (L/D) of 2 or less)
			· Use coolant with more lubricity	· Use JIS A1 grade No.1 or its equivalent
	Chisel Point Breakage	· Off-center starts	· Reduce feed rate at entry point	· f=.0031 to .0047”
			· Pre-machining of flat surface for entry	· Drill flat base with Flat MultiDrill
		· Equipment, part materials, etc. lack rigidity	· Change cutting conditions to reduce resistance	· Increase v_c to decrease f (reduce thrust)
			· Improve clamp strength of work material	
		· Cutting edge is too weak	· Increase size of chisel width	· Use a chisel with a width of .004 to .008”
			· Increase amount of honing on cutting edge	· Increase the width of the thinning area at the centre by 1.5 times
	Breakage on Peripheral Cutting Edge	· Inappropriate cutting conditions	· Decrease the cutting speed	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Reduce feed rate	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Unsuitable coolant	· Use coolant with more lubricity	· Use JIS A1 grade No.1 or its equivalent
		· Equipment, part materials, etc. lack rigidity	· Improve clamp strength of work material	
		· Cutting edge is too weak	· Increase amount of honing on cutting edge	· Increase the width of the outer cutting edge by 1.5 times
			· Reduce the front relief angle	· Reduce the front relief angle by 2 to 3°
		· Entry from peripheral cutting edge	· Increase margin width (W margin specification)	· Increase the margin width by 2 to 3 times
		· Interrupted through cutting	· Reduce feed rate	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Increase amount of honing on cutting edge	· Increase the width of the outer cutting edge by 1.5 times
			· Reduce the front relief angle	· Reduce the front relief angle by 2 to 3°
	Margin Wear	· Inappropriate cutting conditions	· Decrease the cutting speed	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Unsuitable coolant	· Use coolant with more lubricity	· Use JIS A1 grade No.1 or its equivalent
			· Use more coolant	· If using external coolant, switch to internal coolant
		· Remaining margin wear	· Schedule for earlier regrind and ensure back taper	· If margin damage occurs, regrind to 1mm or less
		· Improper tool design	· Increase amount of back taper	· Make back taper 0.5/100
			· Reduce margin width	· Reduce the margin width to around 2/3
	Drill Breakage	· Chip blockage	· Use the optimal cutting conditions and tools	· Refer to recommended cutting conditions listed in the Cutting Tools Catalog
			· Use more coolant	· If using external coolant, switch to internal coolant
		· Holding clamp too weak	· Use strong holding clamp	· If the collet chuck is damaged, replace it · Change the collet holder to the next size up
		· Equipment, part materials, etc. lack rigidity	· Improve clamp strength of part material	
Unsatisfactory Hole Accuracy	Oversized Holes	· Off-centre starts	· Reduce feed rate at entry point	· f=.0031 to .0047”
			· Decrease the cutting speed	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Pre-machining added for entry in planar surfaces	· Planar machining with endmill
		· Drill bit lacks rigidity	· Use the optimal drill type for the hole depth	· Refer to the Cutting Tools Catalog
			· Improve overall drill rigidity	· Large web, small groove width
		· Drill bit has runout	· Improve drill mounting precision	· If the collet chuck is damaged, replace it
			· Improve drill retention rigidity	· Change the collet holder to the next size up
		· Equipment, part materials, etc. lack rigidity	· Improve clamp strength of part material	
	Poor Surface Roughness	· Inappropriate cutting conditions	· Increase the cutting speed	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Reduce feed rate	· Refer to the lower limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Unsuitable coolant	· Use coolant with more lubricity	· Use JIS A1 grade No.1 or its equivalent
	Holes are not straight	· Off-centre starts	· Increase feed rate	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Drill is not mounted properly	· Improve drill mounting precision	· If the collet chuck is damaged, replace it
			· Improve drill retention rigidity	· Change the collet holder to the next size up
		· Equipment, part materials, etc. lack rigidity	· Improve clamp strength of part material	
			· Select a double margin tool	· Refer to the Cutting Tools Catalog
Unsatisfactory Chip Control	Chips clog	· Inappropriate cutting conditions	· Increase cutting speeds	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Increase feed rate	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Poor chip evacuation	· Increase volume if using internal coolant	
	Long Stringy Chips	· Inappropriate cutting conditions	· Increase feed rate	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
			· Increase cutting speeds	· Refer to the upper limit of the recommended cutting conditions listed in the Cutting Tools Catalog
		· Strong cooling effect	· Reduce pressure if using internal coolant	· The pressure should be 0.5 MPa or less if using internal coolant
		· Dull cutting edge	· Reduce amount of edge honing	· Reduce the width to around 2/3

Hardened Steel Machining with CBN - SUMIBORON Edition

■ Recommended Zones for CBN by Workpiece Hardness and Shape

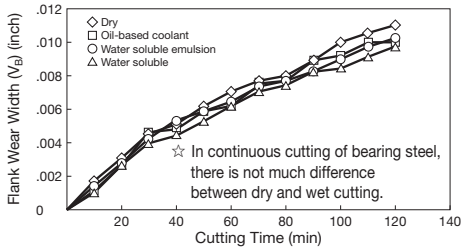


■ Cutting speed recommendations for each part material



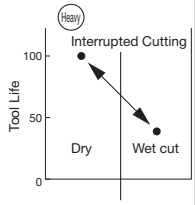
■ Influence of coolant on tool life

● Continuous Cutting



● Interrupted Cutting

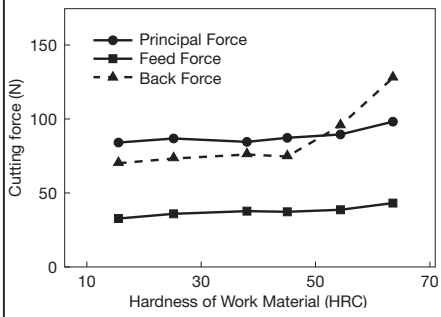
Milling of SKD11 to 4 U grooves
Cutting speed: v_c= 330 SFM
Depth of cut: a_p= .0079"
Feed rate (f)= .0039 IPR

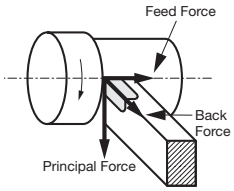


Part material: High Carbon Steel (58 to 62 HRC)
Cutting conditions: TPG321
v_c=330 SFM, a_p=.0059", f=.0039 IPR
Continuous Cutting

For continuous cutting, the influence of coolant on tool life is minimal.
For interrupted cutting, the thermal impact shortens the tool life in wet conditions.

■ Relation between part material hardness and cutting force

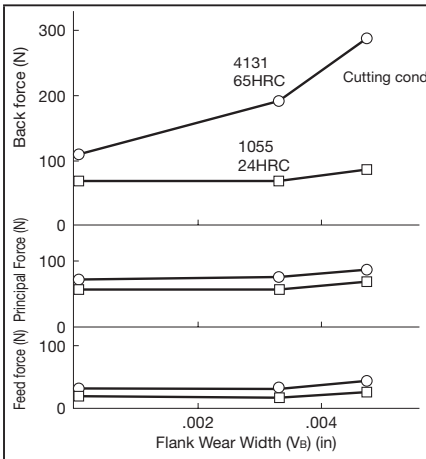




Part Material: Carbon Tool Steel
Cutting Conditions: Cutting speed (v_c) =400 SFM, depth of cut (a_p) =.0079", Feed rate (f) =.0039 IPR

Back force increases substantially for harder workpieces.

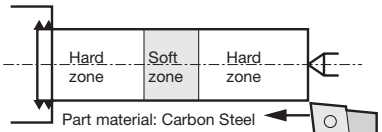
■ Relation between flank wear and cutting force



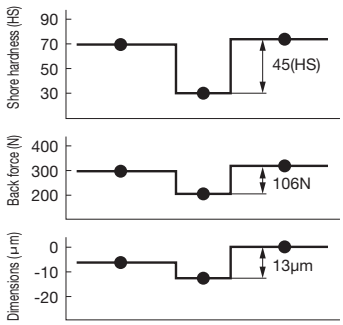
Cutting conditions: Cutting speed (v_c) = 262 SFM
Depth of cut (a_p) = .0059"
Feed rate (f) = .0039 IPR

For hardened steel machining, back force increases substantially due to the expansion of flank wear.

■ Influence of part material hardness on cutting force and accuracy

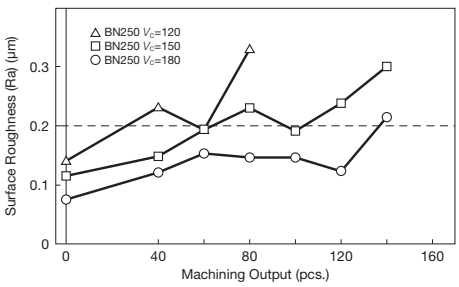


Cutting Speed: v_c = 400 SFM
Depth of Cut : a_p = .0197"
Feed Rate : f = .012 IPR, dry



External dimensions in the soft zone are smaller due to lower cutting forces.

■ Relation between cutting speed and surface roughness



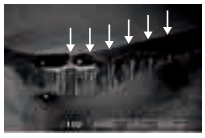
Part material : Alloy Steel 58 to 62HRC
Holder : MTXNR2525
Tool : NU-TNMA160408

Cutting Conditions:
v_c =400,500,600 SFM
f = .0018 IPR
a_p = .0059"
Wet

At high cutting speeds, surface roughness is more stable.

■ Improvement of surface roughness by altering the feed rate

Constant Feed Rate	Variable Feed Rate
 Stationary Notch Location	 Shifting Notch Location
	

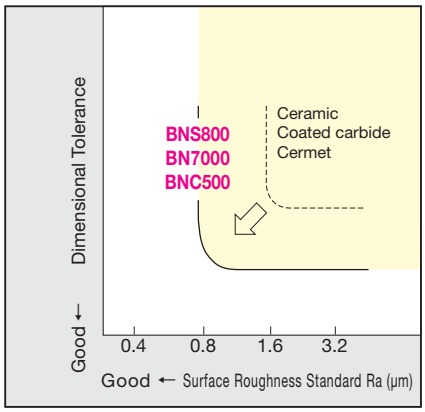


☆ Varying the feed rate spreads the notch location over a larger area.
→Surface finish improves and notch wear decreases.

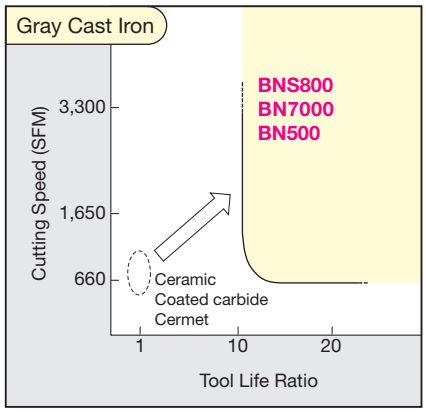
High Speed Machining of Cast Iron with CBN - SUMIBORON Edition

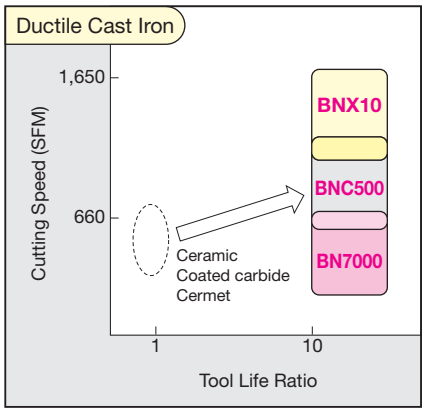
■ Advantages of using CBN - SUMIBORON for cast iron machining

● Higher accuracy



● Longer tool life at higher cutting speeds

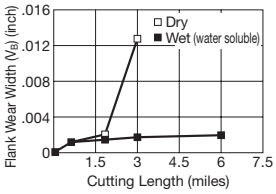




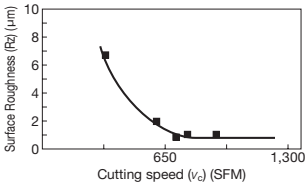
■ Turning

● Cast iron structure and wear shape examples

		Grey Cast Iron	Ductile Cast Iron
Structure			
	Matrix	Pearlite	Pearlite + Ferrite
Tool wear shape	Wet		
	Dry	 Crater wear	
(v_c=660 to 1,650 SFM)



Part material : Continuous cutting with Ductile Cast Iron
Tool material : BN500
Tool Shape : SNG432
Cutting Conditions : v_c = 1,500 SFM
a_p=.0098"
f =.0059 IPR
Dry & Wet
(water soluble)



WET (Water soluble)

DRY

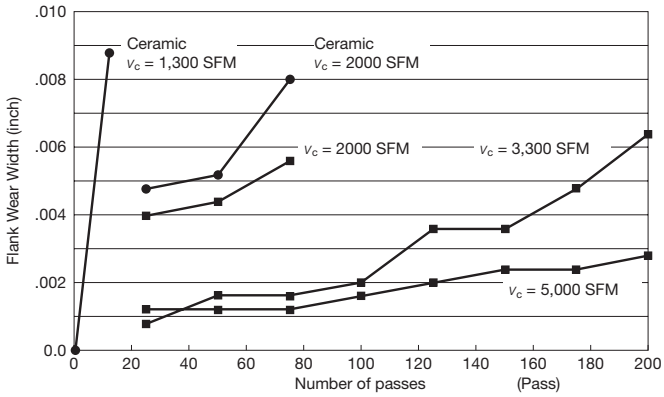
For turning cast iron with CBN, cutting speeds (v_c) should be 660 SFM and above. Wet cutting is recommended.

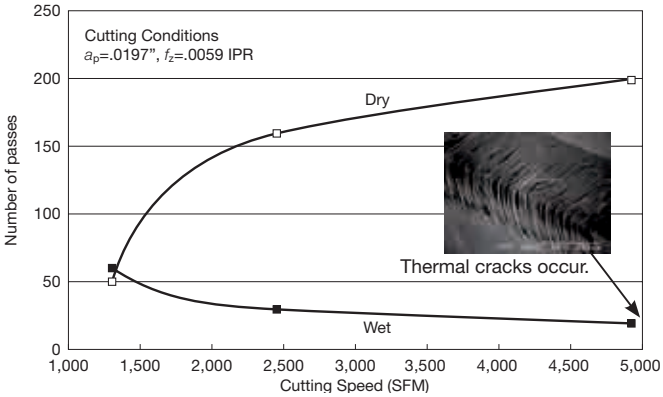
Machine : N/C lathe
Part Material : Ductile Cast Iron
200HB
Holder : MTJNP2525
Tool Grade : BN500
Tool Shape : TNMA332
Cutting Conditions : v_c=360 to 925 SFM
f =.0039 IPR
a_p=.0039"
Wet

■ Milling

BN Finish Mill EASY (for high-speed finishing of cast iron)

- Enables cutting with v_c of 6,600 SFM
- Surface finish roughness 3.2Rz (1.0Ra)
- Economical insert reduces running costs.
- Unit style enables easy runout adjustment.
- Employs safe, anti-centrifugal-force construction for high-speed conditions.





- Part material: Gray cast iron (FC250)
- Cutting conditions: a_p =.0197", f_z =.0039 IPR dry
- Tool grade: BN7000

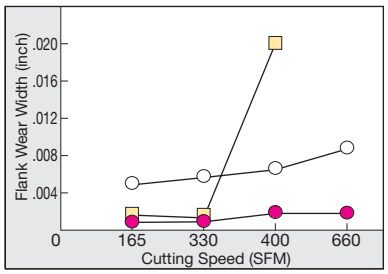
Dry cutting is recommended for high speed milling of cast iron with CBN.

Machining Exotic Alloys with CBN - SUMIBORON Edition

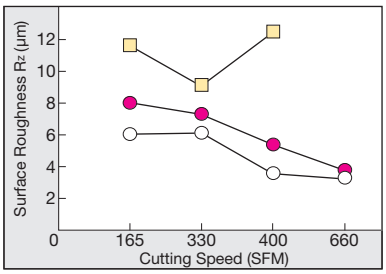
■ Powdered Metal

SUMIBORON — Cemented Carbide — Cermet

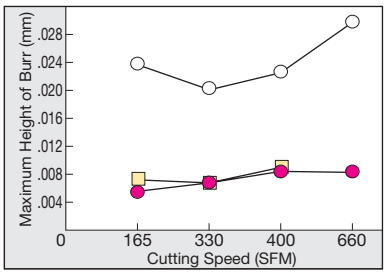
1. Flank wear



2. Surface roughness



3. Height of burr



Part material: Powdered Metal (HRB40), ø3.15-ø3.94" heavy interrupted facing with grooves and drilled holes. (After 40 passes)
Cutting conditions: f=.0039 IR, a_p=.0039" Wet
Tool Cat. No.: TNGA331

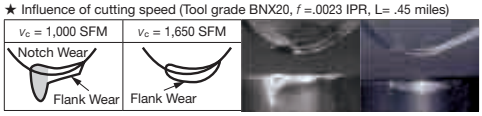
Enables cutting at v_c of up to 330 SFM even with cemented carbide. However, if v_c is around 400 SFM or higher, wear occurs rapidly, resulting in poorer surface roughness and greater spread of burrs. On the other hand, CBN exhibits stability and superior wear resistance, burr prevention and surface roughness, especially at high speeds.

■ Heat-Resistant Alloy

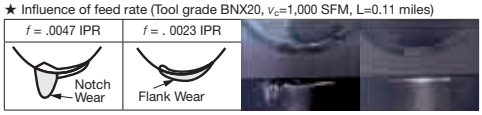
• Nickel based alloy

Typical tool damage of CBN tool when cutting Inconel 718

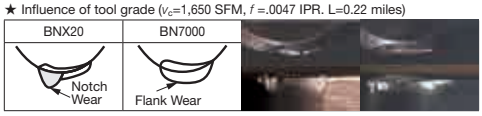
★ Influence of cutting speed (Tool grade BNX20, f =.0023 IPR, L= .45 miles)



★ Influence of feed rate (Tool grade BNX20, v_c=1,000 SFM, L=0.11 miles)



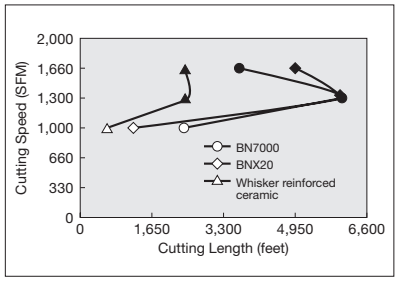
★ Influence of tool grade (v_c=1,650 SFM, f =.0047 IPR. L=0.22 miles)



Cutting Conditions: a_p= .0118", Wet

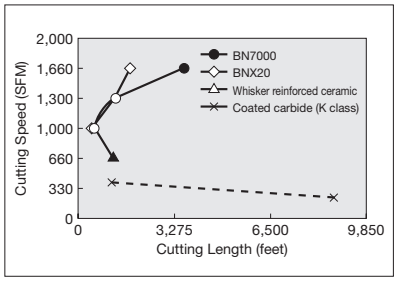
0. 5mm

Cutting conditions: f = .0023 IPR, a_p= .0118", wet



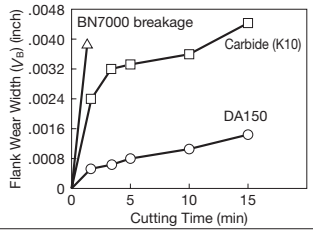
Tool life criteria
Notch wear = .010" (○)
or flank wear = .010"
BNX20 is recommended for high speed and low feed rates; BN7000 is recommended for cutting speeds below v_c = 800 SFM.

Cutting conditions: f = .0047 IPR, a_p= .0118", wet

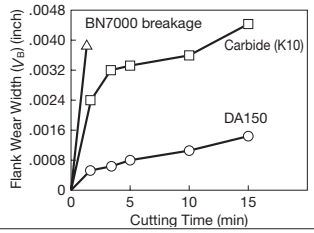


Tool life criteria
Notch wear = .010" (★)
or flank wear = .010"
BN7000 is recommended for cutting at high feed rates (over f = .0039 IPR).

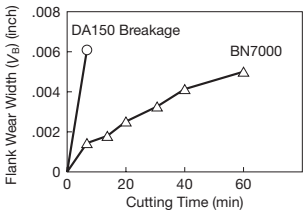
• Ti based alloy



Part material: Ti-6A-4V
Tool: NF-DNMX331
Cutting Conditions: v_c=330 SFM, a_p=.0039", f=.0019 IPR Wet
☆ Our ultra-sharp positive PCD inserts have a strong cutting edge and excellent wear resistance



Part material: Ti-6A-4V
Tool: NF-DNMX331
Cutting Conditions: v_c=330 SFM, a_p=.0039", f=.0019 IPR Wet
☆ Our ultra-sharp positive PCD inserts have a strong cutting edge and excellent wear resistance

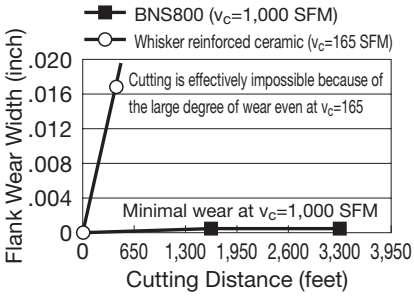


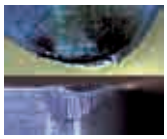
Part material: Ti-6Al-4V
Tool: DNMA434
Cutting Conditions: v_c=400 SFM, a_p=.0118", f=.0098 IPR Wet
☆ Highly fracture-resistant BN7000 negative insert is suitable for high-efficiency machining with large depth of cut and high feed rate.

■ Hard Facing Alloys

Part Material: Colmonoy No.6
(NiCr-based self-fluxing alloy)

Tool Cat. No. : SNG322
Cutting conditions : v_c=165 SFM , 1000 SFM
f = .0039 IPR
a_p= .008"
Dry



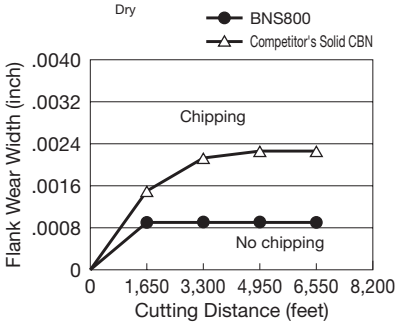


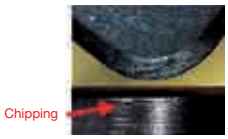
Whisker reinforced ceramic
(v_c = 165 SFM, after 330 feet of cutting)

BNS800
(v_c = 1,000 SFM, after 3,300 feet of cutting)

Part Material: Stellite SF-20
(Co-based self-fluxing alloy)

Tool Cat. No. : SNG322
Cutting conditions : v_c= 165 SFM
f = .0039 IPR
a_p= .008"
Dry





Competitor's Solid CBN
(After 6,500 feet of cutting)

BNS800
(After 6,500 feet of cutting)

Cutting Edge Failure & Countermeasures for Machining Hardened Steel - CBN

Insert Failure	Cause	Countermeasures
Flank Wear	· Grade lacks wear resistance	· Select a more wear-resistant grade (eg BNC2010, BN1000 or BN2000)
	· Cutting speed is too fast	· Reduce the cutting speed to v_c=660 SFM or less (higher feed rate also reduces tool-to-work contact time) · Use an insert with a larger relief angle
Crater Wear	· Grade lacks crater wear resistance	· Select a higher efficiency grade (eg BNC2010, BNX25 or BNX20)
Breakage at Bottom of Crater	· Cutting speed is too fast	· Reduce the cutting speed to v_c=660 SFM or less and increase the feed rate (low speed, high feed) (higher feed rate alone also reduces tool-to-work contact time)
Flaking	· Grade lacks toughness	· Select a tougher grade (eg BNC2020 or BN2000)
	· Back force is too high	· Select an insert with a stronger cutting edge (Increase negative land angle and perform honing) · If the grade is tough enough, improve the cutting edge sharpness
Notch Wear	· High stress at boundary	· Change to a grade with a higher notch wear resistance (e.g. BNC2010 or BN2000) · Increase cutting speed (500 SFM or more) · Change to the Variable Feed Rate method, which alters the feed rate in fixed output intervals · Increase negative land angle and perform honing
Chipping at Forward Notch Position 	· Impact to front cutting edge is too large or occurs constantly	· Change to a micro-grained grade with a higher fracture resistance (e.g. BNC300 and BN350) · Increase the feed rate (higher feed rates are recommended to reduce chipping) · Select an insert with a stronger cutting edge (Increase negative land angle and perform honing)
Chipping at Side Notch Position	· Impact to side cutting edge is too large or occurs constantly	· Change to a grade with a higher fracture resistance (e.g. BN350 or BNC300) · Reduce feed rate · Use an insert with a larger side cutting angle · Use an insert with a larger nose radius · Select an insert with a stronger cutting edge (Increase negative land angle and perform honing)
Thermal Crack	· Thermal shock is too severe	· Completely dry conditions are recommended · Select a grade with better thermal conductivity · Reduce cutting speed, feed rate, and depth of cut to decrease the machining load.

■ Steel and Non-Ferrous Metal Symbols Chart (Excerpt)

● Classifications and Symbols of Steels

Classification	Material	Symbol	Code Description
Steel for Structure	Rolled Steels for welded structures	SM	"M" for "Marine": Usually used in welded marine structures
	Re-rolled Steels	SRB	"R" for "Re-rolled" and "B" for "Bar"
	Rolled steel for general structures	SS	S for "Steel" and S for "Structure"
	Light gauge sections for general structures	SSC	"C" for "Cold" after SS
Steel Sheets	Hot rolled mild steel sheets / plates in coil form	SPH	P for "Plate" and "H" for "Hot"
Steel Tubes	Carbon steel tubes for piping	SGP	"GP" for "Gas Pipe"
	Carbon steel tubes for boiler and heat exchangers	STB	"T" for "Tube" and "B" for "Boiler·
	Seamless steel tubes for high-pressure gas cylinders	STH	"H" for "High Pressure" after ST
	Carbon steel tubes for general structures	STK	"K" for "Kozo" ("structure" in Japanese) after ST
	Carbon steel tubes for mechanical structures	STKM	"M" for "Machine" after STK
	Alloy steel tubes for structures	STKS	"S" for "Special" after STK
	Alloy steel tubes for piping	STPA	"A" for "Alloy" after STP
	Carbon steel tubes for pressure piping	STPG	"P" for "Piping" and "G" for "General" after ST
	Carbon steel tubes for high-temperature piping	STPT	"T" for "Temperature" after ST
	Carbon steel tubes for high-pressure piping	STS	"S" for "Special" after ST
	Stainless steel tubes for piping	SUS-TP	"T" for "Tube" and "P" for "Piping" after SUS
Steel for Mechanical Structures	Carbon steels for mechanical structures	SxxC	"C" for "Carbon"
	Aluminium-chromium-molybdenum steels	SACM	"A" for "Al", "C" for "Cr" and "M" for "Mo"
	Chromium molybdenum steels	SCM	"C" for "Cr" and "M" for "Mo"
	Chromium steels	SCr	"Cr" for "Chromium" after "S" for "Steel"
	Nickel Chromium steels	SNC	"N" for "Nickel" and "C"for "Chromium"
	Nickel Chromium Molybdenum steels	SNCM	"M" for "Molybdenum" in SNC
	Manganese steels for mechanical structures Chromium steels	SMn SMnC	"Mn" for "Manganese" "C" for "Chromium" in SMn
Special Steels – Tool Steels	Carbon tool steels	SK	"K" for "Kogu" ("tool" in Japanese)
	Hollow drill steels	SKC	"C" for "Chisel" after SK
	Alloy tool steel	SKS SKD SKT	S for "Special" after SK D for "Die" after SK T for "Tanzo" - "forging" in Japanese after SK
	High-speed tool steels	SKH	"H" for "High speed" after SK
Special Steels – Stainless Steel	Free cutting sulphuric steels	SUM	"M" for "Machinability" after SU
	High-carbon chromium bearing steels	SUJ	"J" for "Jikuuke" ("bearing" in Japanese) after SU
	Spring steels	SUP	"P" for "Spring" after SU
	Stainless Steel	SUS	"S" for "Stainless Steel" after SU
Special Steels – Heat-resistant Steel	Heat-resistant Steel	SUH	"U" for "Special Usage" and "H" for "Heat"
	Heat-resistant steel bars	SUH-B	"B" for "Bar" after SUH
	Heat-resistant steel sheets	SUHP	"P" for "Plate" after SUH
Forged Steels	Carbon steel forgings for general use	SF	"F" for "Forging"
	Carbon steel booms and billets for forgings	SFB	"B" for "Billet" after SF
	Chromium molybdenum steel forgings	SFCM	"C" for "Chromium" and "M" for "Molybdenum" after SF
	Nickel Chromium Molybdenum steel forgings	SFNCM	"N" for "Nickel" in SFCM
Cast Iron	Gray cast iron	FC	"F" for "Ferrous" and "C" for "Casting"
	Spherical graphite / Ductile cast irons	FCD	"D" for "Ductile" after FC
	Blackheart malleable cast irons	FCMB	"M" for "Malleable" and "B" for "Black" after FC
	Whiteheart malleable cast irons	FCMW	"W" for "White" after FCM
	Pearlite malleable cast iron	FCMP	"P" for "Pearlite" after FCM
Cast Steels	Carbon cast steels	SC	"C" for "Casting"
	Cast stainless steels	SCS	"S" for "Stainless Steel" after SC
	Heat-resistant cast steels	SCH	"H" for "Heat" after SC
	High-manganese cast steels	SCMnH	"Mn" for "Manganese" and "H" for "High" after SC

● Non-Ferrous Metals

Classification	Material	Symbol
Copper and Copper Alloys	Copper and copper alloys - sheets, plates and strips	CxxxxP
		CxxxxPP
		CxxxxR
	Copper and copper alloys - welded pipes and tubes	CxxxxBD
		CxxxxBDS
		CxxxxBE
		CxxxxBF
Aluminum and Aluminum Alloys	Aluminum and Al alloys - Sheets, plates and strips	AxxxxP
		AxxxxPC
	Aluminum and Al alloys Rods, bars, and wires	AxxxxBE
		AxxxxBD
		AxxxxW
	Aluminum and Al alloys - Extruded shapes	AxxxxS
	Aluminum and Al alloy castings	AxxxxFD
		AxxxxFH
Material – Wrought Alloys – Magnesium	Magnesium alloy sheets and plates	MP
Material – Nickel	Nickel-copper alloy sheets and plates	NCuP
	Nickel-copper alloy rods and bars	NCuB
Material – Wrought Materials – Titanium	Titanium rods and bars	TB
Castings	Brass castings	YBsCx
	High-strength brass castings	HBsCx
	Bronze castings	BCx
	Phosphorus Bronze castings	PBCx
	Aluminum bronze castings	AlBCx
	Aluminum alloy castings	AC
	Magnesium alloy castings	MC
	Zinc alloy die castings	ZDCx
	Aluminum alloy die castings	ADC
	Magnesium alloy die castings	MDC
	White metals	WJ
	Aluminum alloy castings for bearings	AJ
	Copper-lead alloy castings for bearings	KJ

■ Hardness Scale Comparison Chart

● Approximate corresponding values for steel hardness on the Brinell scale

Brinell 3,000kgf HB	Rockwell Hardness A Scale 60kgf brale HRA	B Scale 100kgf 1/10in ball HRB	C Scale 150kgf brale HRC	D Scale 100kgf brale HRD	Vickers 50kgf HV	Shore Hardness HS	Tensile Strength (GPa)

Note (1) The fractional values are the taper standards.
(2) Diameters D_1 and d_1 are calculated from the diameter D value, the taper, a, and ℓ_1 and rounded up to one decimal place.
Remark 1. Tapers are measured using JIS B 3301 ring gauges. At least 75% must be correct.
2. Screws must have metric coarse screw thread as per JIS B 0205 and Class 3 precision as per JIS B 0209.

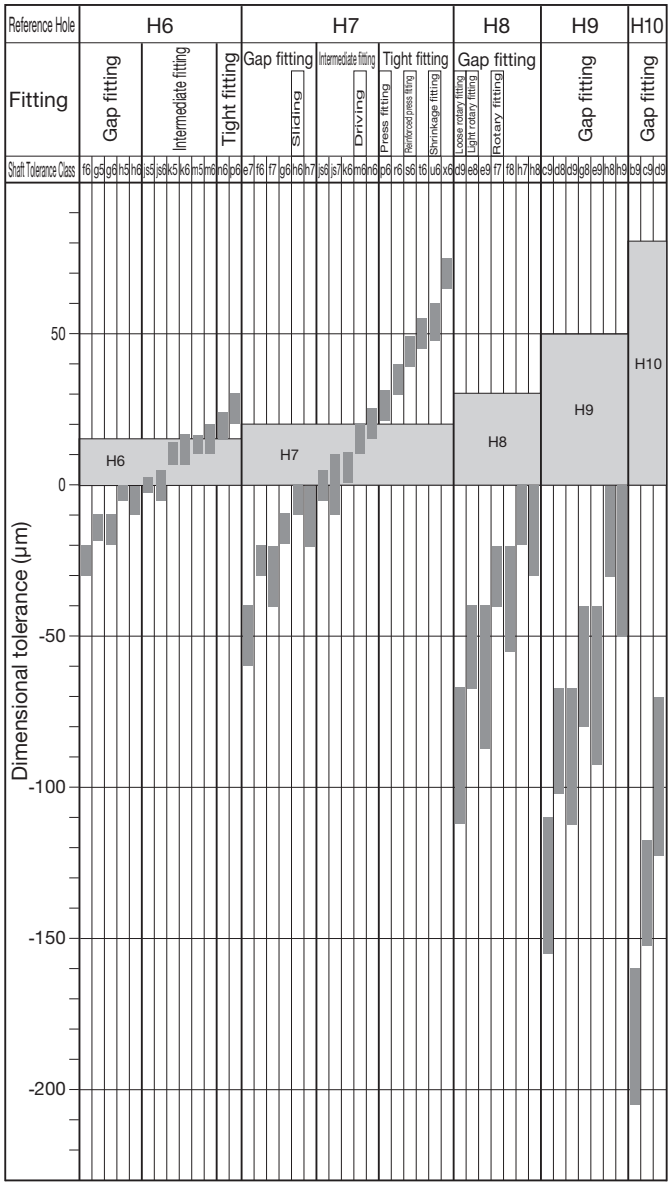
h9			D8	E8			H8										
		C9	D9	E9			H9										
	B10	C10	D10														

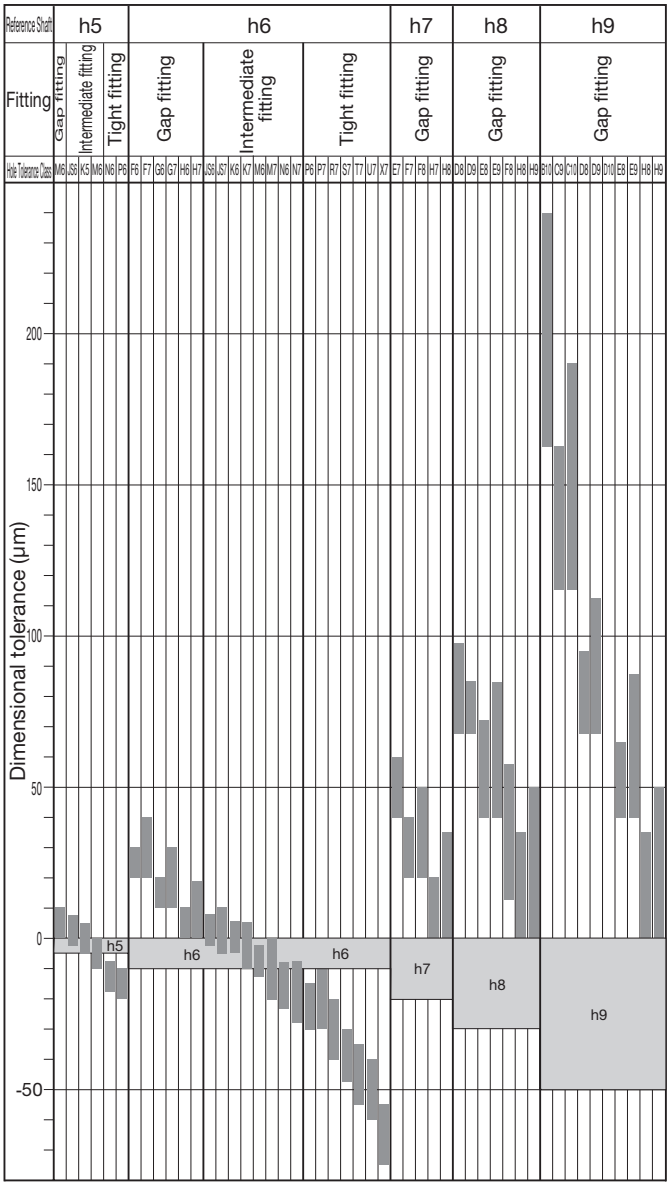
Note: *Exceptions may arise with these fittings depending on the dimension category.

● Correlation of Tolerance Zones in Standard Hole Fittings



Note: The above table is for reference dimensions greater than 18mm up to 30mm.

● Correlation of Tolerance Zones in Standard Shaft Fittings



Note: The above table is for reference dimensions greater than 18mm up to 30mm.

■ Surface Roughness

● Types and Definitions of Typical Surface Roughness

Type	Symbol	Method of Determination	Descriptive Figure
R Max.	*1) Rz	This value is found by extracting the reference length in the mean line direction from the surface roughness curve, measuring the intervals between the peaks and valleys in the extracted area in the longitudinal magnification direction of the surface roughness curve, and expressing this value in micrometres (μm). Remarks: When finding Rz, any areas deemed to be scratches are removed before extracting the reference length from an area with no high peaks or low valleys.	 Rz=Rp+Rv
Calculated Roughness	Ra	This value is found by extracting the reference length in the mean line direction from the roughness curve, taking the average line direction of the extracted area as the X-axis and the longitudinal magnification direction as the Y-axis and expressing the value found by the equation below in micrometres (μm) with the roughness curve expressed by y=f(x).	 $Ra=\frac{1}{\ell}\int_0^{\ell}\{f(x)\}dx$
10-point Average Roughness	*2) Rz JIS	This value is found by extracting the reference length in the mean line direction from the roughness curve, finding the sum of the mean absolute peak height taken from the five highest peaks (Yp) and the mean absolute valley height taken from the five lowest valleys (Yv) measured in the longitudinal magnification direction from the average line direction of the extracted area and expressing this value in micrometres (μm).	 $Rz_{JIS}=\frac{(Yp_1+Yp_2+Yp_3+Yp_4+Yp_5)+(Yv_1+Yv_2+Yv_3+Yv_4+Yv_5)}{5}$

Designated values for the above types of maximum height (Rz)*1), 10-point average roughness (Rz JIS)*2), calculated average roughness (Ra) classifications, and reference length ℓ are shown on the table at right with triangular symbols.

*1) The maximum height symbol (Rz) is calculated according to the new JIS B 0601:2001 standard. (This value was Ry under the old standard.)

*2) The 10-point average roughness (Rz JIS) is calculated according to the new JIS B 0601:2001 standard. (This value was Rz under the old standard.)

● Relationship with triangular symbol display

Designated values for maximum height *1) (Rz)	Designated values for calculated average roughness (Ra)	Designated values for 10-point average roughness *2) (RzJIS)	Standard reference ℓ length value (*mm*)	Triangular* Symbols
(0.05) 0.1 0.2 0.4	(0.012) 0.025 0.05 0.10	(0.05) 0.1 0.2 0.4	*0.25*	▽▽▽▽
0.8	0.20	0.8		
1.6 3.2 6.3	0.40 0.80 1.6	1.6 3.2 6.3	*0.8*	▽▽▽
12.5 (18) 25	3.2 6.3	12.5 (18) 25	*2.5*	▽▽
(35) 50 (70) 100	12.5 25	(35) 50 (70) 100	*8*	▽
(140) 200 (280) 400 (560)	(50) (100)	(140) 200 (280) 400 (560)	—	—

Remarks: The designated values in ( ) do not apply unless otherwise stated.

* Finish symbols (triangular symbol (▽) and tilde (~)) were removed from JIS in the 1994 revision.

Index Reference Guide

- **The catalog numbers in this index are listed in alphabetical order.**
- **Catalogue number markings:**
  - ● **mark: Represents a numeral**

    (Example: APG4●●●R → APG4160R)

  - ■ **mark: Represents an alphabetical character**

    (Example: C●●■-SCLCR●● → C08H-SCLCR06)

PCD Rotating Tools

Features

- A single reamer can finish multi-stage holes, reducing work processes.
- Delivering an excellent surface finish unobtainable with carbide tools.
- Precise and stable dimensional and shape accuracy unique to diamond tools can be maintained for a long time.
- Cutting speed and feed can be tuned to reduce machining time.

Data 1: Improved Productivity due to Breaking Chips

Negative Land Specification Cutting Edge

The chipbreaker function has been enhanced to prevent a reduction in productivity due to problems caused by chips. Solutions are proposed according to the type of chip problem.

Without Chipbreaker

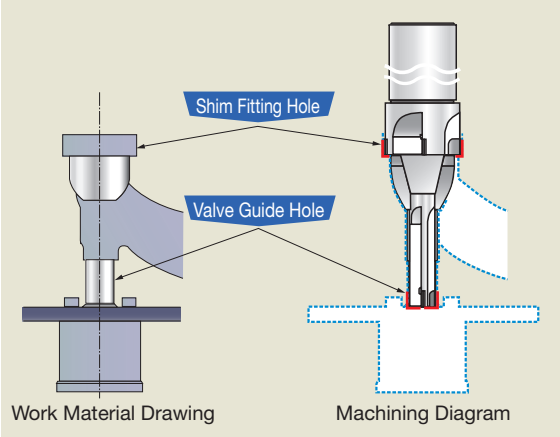
Long chips formed without curl.
· Wrapping around tool
· Remains on workpiece

With Chipbreaker

Chips are forcibly curled and break into small pieces.

Data 2: Good Balance between High-efficiency Cutting and High Machining Accuracy

High-precision / high-efficiency machining is realised through high-quality cutting edge accuracy created by diamond precision machining technology.



Difference in Performance by Shank Material

Results	1 Flute	4 Flute (Steel)	4 Flute (Cemented Carbide)
Machining Time (s)	52	26	13
Circularity (mm)	0.01	0.05	0.03
Coaxiality (mm)	0.01	0.07	0.05

Cutting Conditions

Machine	Horizontal Machining Centre
Tool Size (mm)	ø11 to ø36 to L150
Work Material	Aluminum Alloy Castings AC4B
Coolant	Emulsion-type water-soluble oil
Spindle Speed (min^{-1})	3,500
Cutting Speed (m/min)	395
Feed Rate (mm/rev)	0.3
Allowance (mm/diameter)	0.5

Tool Lineup for Cylinder Head Machining

■ PCD Reamer for Solenoid Hole Machining
Multi-blade/multi-stage high-precision reamers ensure coaxial accuracy.

■ PCD Reamer for Spark Plug Hole Machining
High-precision coaxial machining is realised by increasing the number of teeth at the machining start section (second stage).

■ PCD Cutter for Cam Grooving
Staggered blades are used to lower cutting resistance and achieve high-precision grooving with less chatter.

■ PCD Reamer (1-flute) for Valve Lifter Hole Machining
Guide pad design with attention to rotation balance realises high-precision hole finishing.

■ PCD Endmill for Spring Shim Machining
Cutting edges has a chipbreaker function, preventing chips from entering the water jacket.

■ PCD Reamer for HLA Hole Machining
Special 2 blade design can handle large lateral holes, preventing cutting edge drops.

■ Finishing
Improves chip evacuation and achieves a high cylindricity using a design ideal for machining of thin-wall parts and blind holes.

● Cutting Conditions

Machine	Horizontal Machining Centre
Coolant	Emulsion-type water-soluble oil
Spindle Speed (min^{-1})	5,000
Feed Rate (mm/min)	1,700
Feed Rate (mm/rev)	0.34
Allowance (mm/diameter)	0.5

*HLA: Abbreviation for hydraulic lash adjuster

■ PCD Ball Endmill for Cam Half-Rounding
The use of PCD increases machining accuracy and reduces machining load in later processes.

■ PCD Reamer for Cam Sensor Hole Machining
The cutting force is reduced, improving the cutting speed and accuracy.

■ PCD Reamer for Parent Metal Hole Machining
The use of a high-rigidity body enables high-coaxial finishing of guide holes and shim holes before press-fitting.

■ PCD Endmill for Valve Throat Machining
Simultaneous roughing of the parent metal insert section and throat machining.

■ Parent Hole Finishing
Achieves a good balance between coaxiality and cylindricity with a high rigidity shank and high cutting edge precision.

● Cutting Conditions

Machine	Horizontal Machining Centre
Coolant	Emulsion-type water-soluble oil
Spindle Speed (min^{-1})	6,000
Feed Rate (mm/min)	2,880
Feed Rate (mm/rev)	0.48
Allowance (mm/diameter)	0.6

■ PCD Endmill for Valve Throat Machining
Achieves longer tool life in throat machining through high-precision runout and contour accuracy.

For Valve Guide Hole Cutting

PCD Rotating Tools

Because the valve guide uses sintered alloy and cast iron, the use of a reamer with a cemented carbide cutting edge shortens the tool life and increases the frequency of tool exchange, decreasing machining efficiency. In valve guide hole machining, because the cutting speed is slow with hole diameter around 5mm, a diamond cutting edge with high wear resistance is superior to cemented carbide in cutting edge sharpness sustainability and tool life.
We propose high-precision, high-efficiency machining through tool design in accordance with the required quality and cutting conditions.

Features

- Tool life is around 10x that of carbide tools.
- High-precision and high-efficiency machining can be achieved.

PCD Valve Guide Reamer for 4 flute Finishing

Fine-pitch, rigid tool design realises high-feed machining.

PCD Valve Guide Reamer for 1 flute Pilot Machining

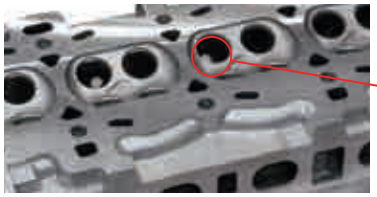
Used for high-precision finishing of prepared holes.
High-efficiency fine-pitch designs are also available.

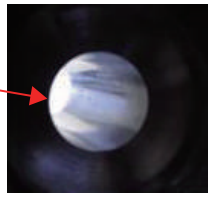
PCD Valve Guide Reamer with Helix Angle for 4 flute Finishing

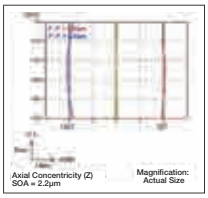
High-quality valve guide hole machining is enabled with a negative helix angle cutting edge, making it easier to evacuate chips in the feed direction.

PCD Valve Guide Reamer for 1 flute Finishing

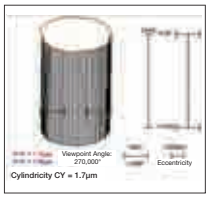
This finishing tool has a leading edge that fits the pilot hole.
Achieves high-precision machining with a high-rigidity body.



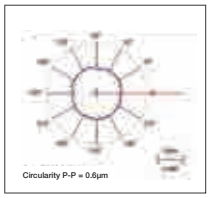




Linearity 2.2 µm



Cylindricity 1.7 µm



Circularity 0.6 µm

PCD Rotating Tools

Valve body spool hole machining is one of the most difficult types of machining. Hole finishing, which involves both interrupted cutting and multi-stage machining, requires high machining accuracy in quality issues such as surface roughness, circularity, cylindricity, and coaxiality.
A.L.M.T. proposes ideal tool designs based on various machining experience.

■ Features

- A single reamer can finish multi-stage holes, reducing work processes.
- Delivering an excellent surface finish unobtainable with carbide tools.
- Precise and stable dimensional and shape accuracy unique to diamond tools can be maintained for a long time.
- Cutting speed and feed can be tuned to reduce machining time.

Tool Lineup for Valve Body Machining

■ 1 flute 4-stage PCD Reamer

Single-flute multi-stepped design realizes high circularity and coaxiality.

■ 4 flute 4-stage PCD Reamer with Leading Edge

With a leading edge added to each cutting edge, position deviation from the previous process is prevented, the result is high-precision hole finishing at high feed conditions.

■ 4 flute 3-stage PCD Drill

Medium finishing for pre-cast hole drilling, high feed and high-accuracy prepared hole drilling are possible.

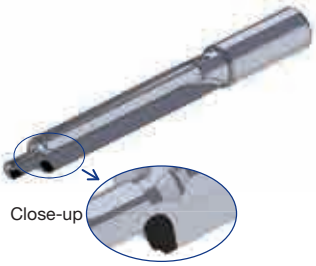
■ 5 flute Irregular Pitched 3-stage PCD Reamer

With irregular pitched cutting edges, vibration (resonance) during machining is suppressed and circularity and cylindricity are improved.

■ 2 flute 4-stage PCD Drill

Medium finishing for deep hole drilling, multi-step machining improves finished coaxiality.

Various additional function proposals

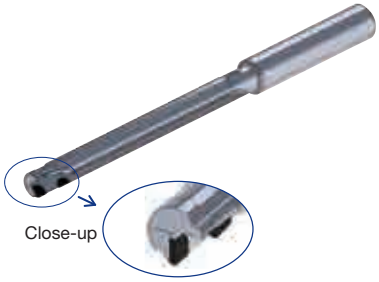


■ Workpiece chipping prevention function

The area around the hole exit is weak, cutting forces may cause chipping of the workpiece along with chips or ring-shaped chips that can wrap around the workpiece.
This can be prevented by a cutting edge design that suppresses cutting resistance.

■ Chip breaking function

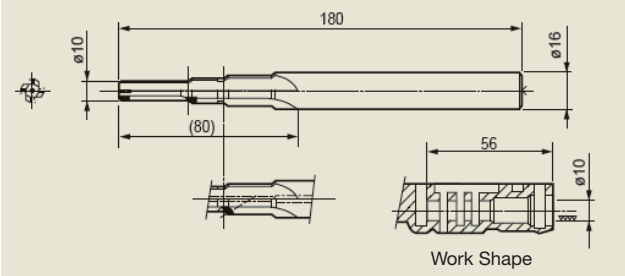
Addition of a chip breaking function to the cutting edge prevents quality deterioration due to machining defects and machine stoppage due to chip entanglement onto the holder.



■ Chip evacuation function

Single cutting edge with a chip discharge groove in the guide pad section prevents adhesion to the cutting edge, thus preventing quality deterioration.

Valve Body Application Examples



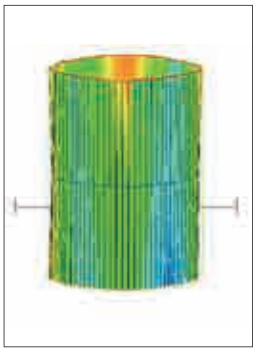
Functions		PCD Reamer	Cemented Carbide Reamer
Cutting Speed	(m/min)	120	120
Feed Rate	(mm/rev)	0.2	0.2
Allowance	(mm/dia.)	0.4	0.4
Coolant		Water soluble	Non-water-soluble Cutting Oil
Machined Surface Roughness	Rz (μm)	3	8
Circularity	(μm)	1 to 3	3 to 6
Economic Efficiency Ratio		0.5	1

Proposals for High-speed Feeds and Chatter Reduction with Irregular-pitched Reamers

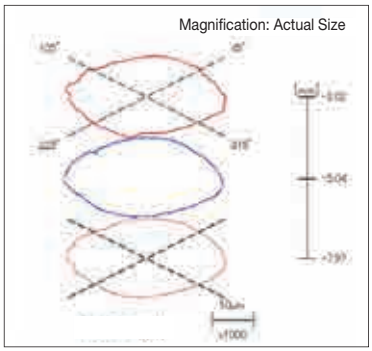
- Using an irregular pitch design that focuses on rotational balance prevents resonance due to cutting resistance and cutting edge biting inside the hole, enabling high-precision machining.
- The above results in suppressed chatter as well as improved circularity and cylindricity.
- In comparison to 1-flute machining, even at the same speed, multi-flute machining enables higher feed rate and thus reduces machining time.

Application Examples

		1 flute Balance Specification	4 Flutes	4 flute Irregular Pitch	5 flute Irregular Pitch
Shape					
Allowance	(mm/dia.)	0.5 to 0.7			0.5 to 0.7
Spindle Speed	(min^{-1})	1,000			1,000
Feed Rate	(mm/min)	400	960		960
Feed Rate per Revolution	(mm/rev)	0.1	0.24		0.24
Feed Rate per Cutting Edge	(mm/z)	0.1	0.06		0.05
Coolant		Emulsion-type water-soluble oil			Emulsion-type water-soluble oil
Chatter		No	Yes	No	No
Cylindricity	(μm)	6	6	4	3



Cylindricity 3 μm



Coaxiality 1 μm

*Image only.

PCD Rotating Tools

In recent years, aluminum steering parts have become lighter, and there is a demand for shorter machining time at higher feed rates. Our proprietary tool design achieves both reduced machining time and high machining quality.

Features

- A single reamer can finish multi-stage holes, reducing work processes.
- Delivering an excellent surface finish unobtainable with carbide tools.
- Precise and stable dimensional and shape accuracy unique to diamond tools can be maintained for a long time.
- Cutting speed and feed can be tuned to reduce machining time.

Tool Lineup for Steering Housing Machining

4 flute 8-stage PCD Reamer

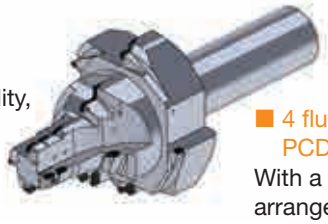
Multi-blade/multi-stage PCD reamers with high-precision finishing for excellent coaxial machining.

5 flute Irregular Pitched PCD Reamer

Irregularly pitched 5 flute design suppresses chatter to improve deep hole circularity.

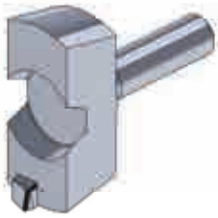
4 flute Irregular Pitched PCD Reamer with Interface

Structure with interface realises high rigidity, high feed, and high-precision machining.



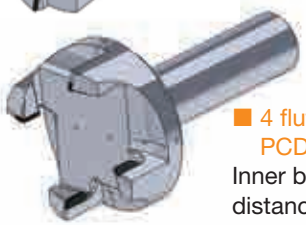
4 flute + 5 flute Irregular Pitched PCD Reamer

With a design that uses a different arrangement for each step of the cutting edges, vibration (resonance) in machining is prevented thus creating high-precision machining.



Cutting Edge Indexable PCD Mill for Facing

Opening facing with 1 flute and corner insert method reduce tool running costs.



4 flute Blade for Peripheral Machining PCD Endmill

Inner blade design keeps machining distance short, enabling protrusion plunging or contouring, so that machining time can be reduced.

5 flute + 3 flute PCD Reamer

PCD 5 flute cutting edge and PCD 5-flute guide improve circularity, with 3 flutes at opening to suppress chatter.

Proposals for Reducing Processes with Combination Tools

Combination of Threading (indexable) and Grooving

Three processes (tapping + grooving + reaming) are integrated into a single tool, reducing tool change time and number of tools required.

Combination of Back Spot Facing and Reamer

Drilling and back spot facing can be machined with a single tool. Contouring is performed with offset from axis of rotation.

Combination of Endmill with Central Insert and Reamer

By finishing the bottom face during the reaming process, machining time can be reduced while improving bottom face diameter, flatness and surface roughness.

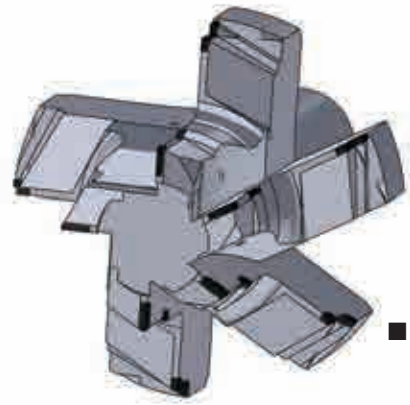
Combination of Face Grooving and Back Boring

Process is reduced by shifting off-center of the prepared hole to perform back boring, after the front face grooving operation. Boring diameter is adjustable.

Proposals for High-speed Feeds and Chatter Reduction with Irregular-pitched Reamers

Features

- Extremely effective for improving chatter prevention, cylindricity, and circularity.
- Cycle time can be shortened by a third compared to the use of 4 flutes.
- Design with attention to rotating balance.



■ 5 flute Irregular Pitched Reamer

Application Examples

	4 flute Regular Pitch	4 flute Irregular Pitch	5 flute Irregular Pitch	
Shape				
Allowance (mm/dia.)	0.5 to 0.7		0.5 to 0.7	
Spindle Speed (min^{-1})	1,000		1,000	
Feed Rate (mm/min)	400		400	125
Feed Rate (mm/rev)	0.4		0.4	0.125
Coolant	Emulsion-type water-soluble oil		Emulsion-type water-soluble oil	
Chatter	Yes		No	
Circularity (μm)	24	18	8	4

Ultra-Precision Cutting Tool BLPCD UPC

Achieves long tool life in mirror finish and fine machining of cemented carbides

SUMIDIA BINDERLESS is a new material developed by Sumitomo Electric Industries, Ltd. Fine grains of a few tens of nanometres are firmly and directly bonded together without the use of a binder, achieving a hardness exceeding that of single crystal diamond. There is also no anisotropy or specific cleavage.
Combined with our signature diamond precision grinding technology, this material enables unprecedented tool life and chipping resistance.

Features

[Features of SUMIDIA BINDERLESS]

- Fine grains of a few tens of nanometres are firmly and directly bonded together without the use of a binder.
- Harder than single-crystal diamond.
- No anisotropy or specific cleavage.

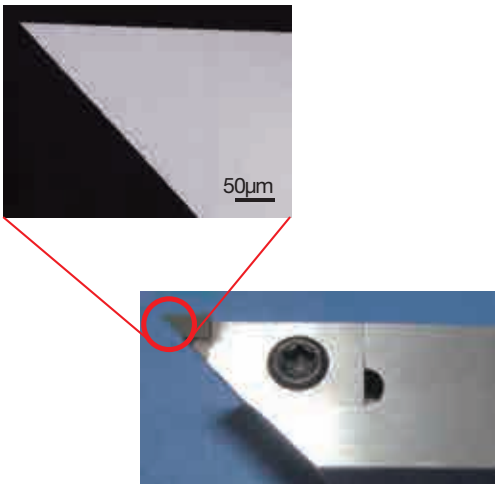
[Features of BLPCD UPC]

- Superior fracture and wear resistance compared to single/polycrystalline diamond.
- Sharp and precise cutting edge equivalent to UPC (single-crystal diamond).
- Free from uneven wear caused by crystal orientation, as it is not anisotropic.

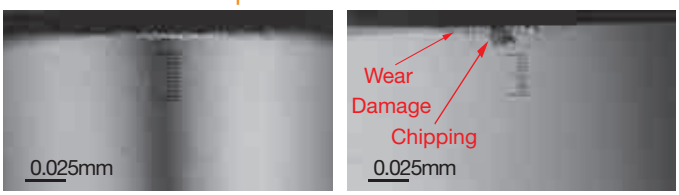
Applications

- Machining of cemented carbide glass lens molds and other high-hardness and brittle materials

Sharp Cutting Edge Equivalent to Single Crystal Diamond

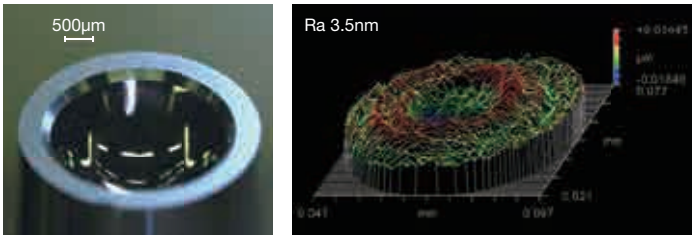


Flank Wear Comparison of Machined Cemented Carbide



BLPCD UPC	UPC (Single-crystal Diamond)
No Large Chipping Found	Large Chipping Found

Surface Roughness of Machined Cemented Carbide



*"SUMIDIA" is a registered trademark of Sumitomo Electric Industries, Ltd.

For Various Mold Machining (Spherical/Non-Spherical, Camera Lens Molds, etc.)

Ultra-precision Cutting Tool UPC-R

Exhibits outstanding performance in ultra-precision cutting

An ultra-precision cutting tool for machining of molds used for products like spherical/aspherical lenses and camera lenses where extremely high precision is called for.

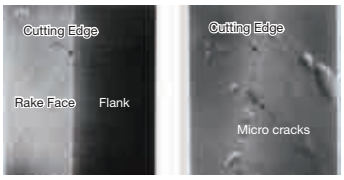
Our proprietary development process yields high-precision polished blades which realise microscopic shaping of workpieces with high precision on the nanometre level.

Features

- The cutting edge is uniformly finished in high quality, achieving nanometre-level surface roughness.
- An inspection report of the cutting edge arc waviness is attached to the product for thorough quality control.

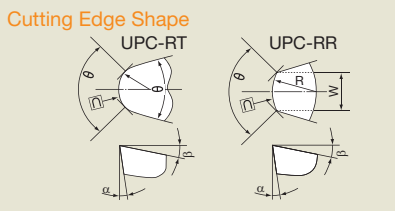
Applications

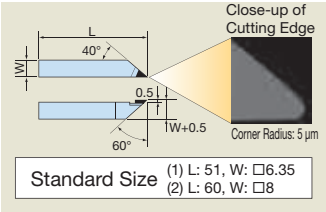
- BD pickup lens molds, digital camera lens molds, camera lens molds for smartphones/computers/tablets, spherical/aspherical mirrors, etc.



UPC cutting edge — Cutting edge with microscopic irregularities

- Sharp Cutting Edge
  Machining without deforming or damaging workpieces during fine finishing
  Nanometre-level fine machining is possible
- Cutting Edge Without Chipping
  Mirror surface without transfer of workpiece irregularities
  Mirror finishing of Ra 5nm or less is possible





Dimensions and Highest Accuracy

Cat. No.		Edge Waviness (μm) ∩			Corner Radius R	Cutting Edge Angle θ	Width of Cut W (RR)	Relief Angle α	Rake Angle β
		θ ≤90°	θ ≤120°	θ ≤150°					
UPC-R	Very High Precision	0.05	0.1	0.20	0.002 to 200	20° or more	0.5 to 5	0° to 20°	-30° to 10°
	High Precision	0.25	0.5	1					

*Please consult us as dimensions and accuracy vary depending on the combination of each element.

For Various Mold Machining (Infrared Lens Molds, etc.)

Ultra-precision Cutting Tool UPC-R

Makes its presence felt in fine machining of hard brittle material

Tool life was a problem when machining germanium and silicon lenses used in infrared sensors and night-vision lenses.

Proprietary fine edge treatment applied to a single-crystal diamond cutting edge has enabled significant extension of tool life.

Features

- Cutting edge height (centre height) is the same on any conical surface.
- Sharp cutting edge with nanometric precision.
- Cutting edge can achieve 0.05μm waviness precision.
- Also applicable to machining of calcium fluoride or cemented carbide.

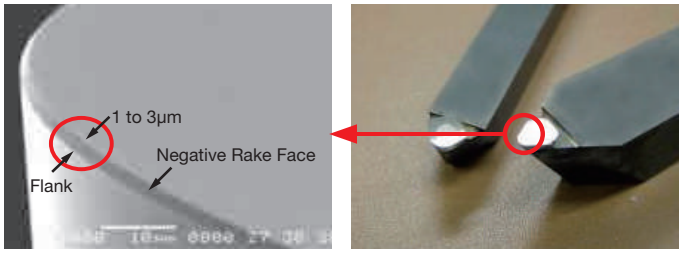
Applications

- Infrared sensor lenses, night-vision camera lenses, germanium lenses, silicon lenses, calcium fluoride lenses, cobalt-free carbide molds

Comparative Examples

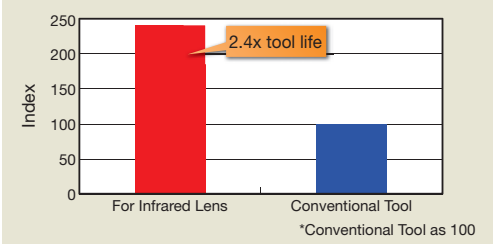
1) Work Material : Infrared sensor transmissive lens, ø95mm germanium
2) Tool Specification : Corner radius 1.5mm, relief angle 10°
3) Cutting Conditions : Rotation speed 2,000min^{-1}, feed rate 1.75μm/rev, allowance 1.5μm

UPC Cutting Edge for Infrared (IR) Lenses and Cemented Carbide Molds



Uniform Negative Rake Face of Cutting Edge

Results



For Optical Shim Mold Machining, etc.

Ultra-precision Cutting Tool UPC-Nano Groove

Enables high-precision linear grooving with a cutting edge width among the world's smallest.

Grooving holder with 5μm minimum groove width. Enables quick high-aspect-ratio machining that cannot be achieved using the photolithography method or ion-beam method. The high-precision, durable cutting edge is the ideal tool for fine, clear grooving of hologram diffraction gratings, linear fine grooving, LCD light guide plates, and so on.

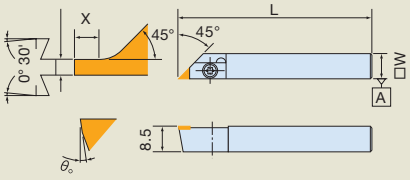
Features

- Grooving holder with 5μm minimum groove width.
- Durable cutting edge with high-precision grinding.
- Enables high-precision fine grooving that cannot be achieved using the photolithography method or ion-beam method.

Applications

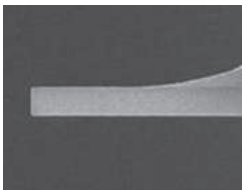
- For linear fine grooving, optical shim molds, light guide plate mold machining

Cutting Edge Shape

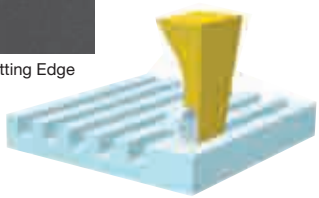


Standard Size	(1) L: 51, W: □6.35 (2) L: 60, W: □8

Cutting Edge Shape



Nano Groove Cutting Edge



For Micro Lens Array Mold Machining, etc.

Ultra-precision Cutting Tool UPC-Nano Ball Endmill

World's smallest ballnose endmill

Enables high-precision 3D machining with its extremely sharp cutting edge. Fine 3D curved surfaces can also be machined, as well as quick machining of multiple fine spherical holes.

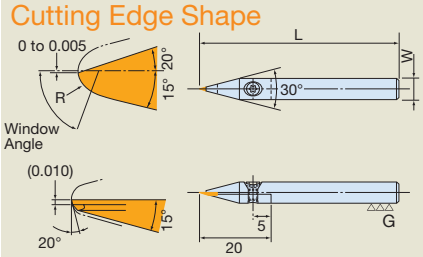
Features

- This ballnose endmill is the world's smallest in its class with a radius of 30μm.
- World's highest class profile of 50nm is also possible.
- Enables high-precision 3D machining with its extremely sharp cutting edge.

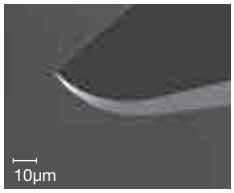
Applications

- For micro lens array molds, LCD light guide plate molds, fine machining molds

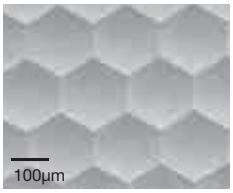
Cutting Edge Shape



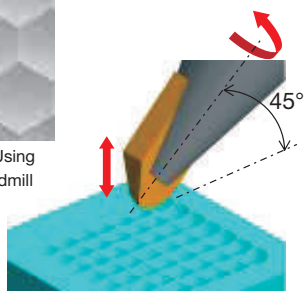
Standard Size	(1) L: 50, W: ø6 (2) L: 40, W: ø4



Cutting Edge Shape



Example of Cutting Using a Nano Ballnose Endmill



For LCD Light Guide Plate Mold Machining, etc.

Ultra-precision Cutting Tool UPC-Nano Endmill

Enables world's smallest class of free-form fine grooving

This endmill enables machining of rectangular grooves along free curves.
Enables quick high-aspect-ratio machining in edged shapes that cannot be achieved using the photolithography method or ion-beam method.

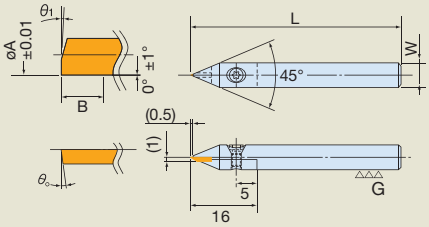
Features

- Enables machining with a high aspect ratio 2.5 times the rotation diameter.
- Durable cutting edge with high-precision grinding.
- Enables high-precision fine grooving that cannot be achieved using the photolithography method or ion-beam method.

Applications

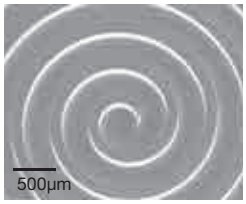
- For machining of LCD light guide plate molds, hologram diffraction grating molds, free-form fine grooving

Cutting Edge Shape

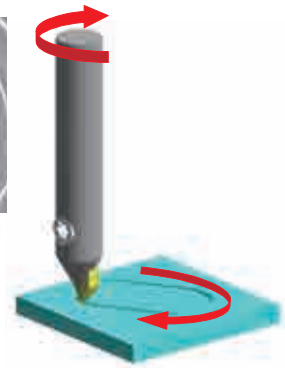


Standard Size	(1) L: 50, W: ø6 (2) L: 40, W: ø4

Cutting Edge Shape



Example of Cutting Using a Nano Endmill



For Optical Shim Mold Machining, etc.

Ultra-precision Cutting Tool UPC-Nano Profile

Formed Single Crystal Diamond Tool with Free-form Cutting Edge

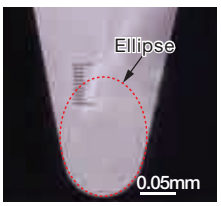
When machining multiple formed grooves or over a long distance, a formed tool makes it easy. UPC-Nano Profile is an ultra-fine formed cutting tool with a free-form profile on its single crystal diamond cutting edge.

Features

- Enables flexible one-pass machining of free-form surfaces including elliptical and paraboloidal surfaces with a profile accuracy of 1μm or less.
- Ensures high-profile accuracy in machining of paraboloidal and other free-form surfaces.

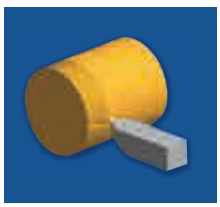
Applications

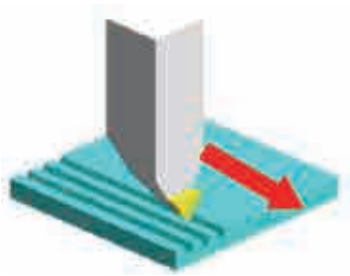
- For optical lens molds, liquid crystal panel optical shim molds, micro lens array molds



Oval Cutting Edge Shape

Concave Round Cutting Edge Shape





For Glasses Lens Roughing

PCD Face Milling Cutters

Efficiency is improved not only for face milling but also free-form profile milling and grooving. Tool specifications can be manufactured to order with requirements like mono-block tool bodies and indexable cutting edges.

Features

- Improves machined surface roughness and suppresses burrs.
- Proprietary tool design balances reduced machining time and tool life.

Applications

- Glasses lens roughing, resin molded parts, aluminum die cast alloys and other non-ferrous metal components

For Glasses Lens Finishing

New D Holders

The sharp cutting edge achieves the high shape precision and mirror finish required for glasses lens finishing.

Features

- The combination of our uniquely designed inserts and holders enables easy and precise tool setting, as with indexable inserts.
- The rake face is free from adhesion and accumulation of chips, maintaining a high quality in worked surfaces even during continuous use.

Applications

- For Glasses Lens Finishing
- For Resin Part Machining

Comparative Examples (Glasses Lens Machining Examples)

		[Results]	
1) Tool Specification	R2.0 Relief Angle 18°	Shape Precision:	0.8μm
2) Cutting Speed	1,200m/min	Surface Roughness (Ra):	0.1μm
3) Feed Rate	0.25mm/rev	Output:	2,000 pcs
4) Depth of Cut	0.08mm

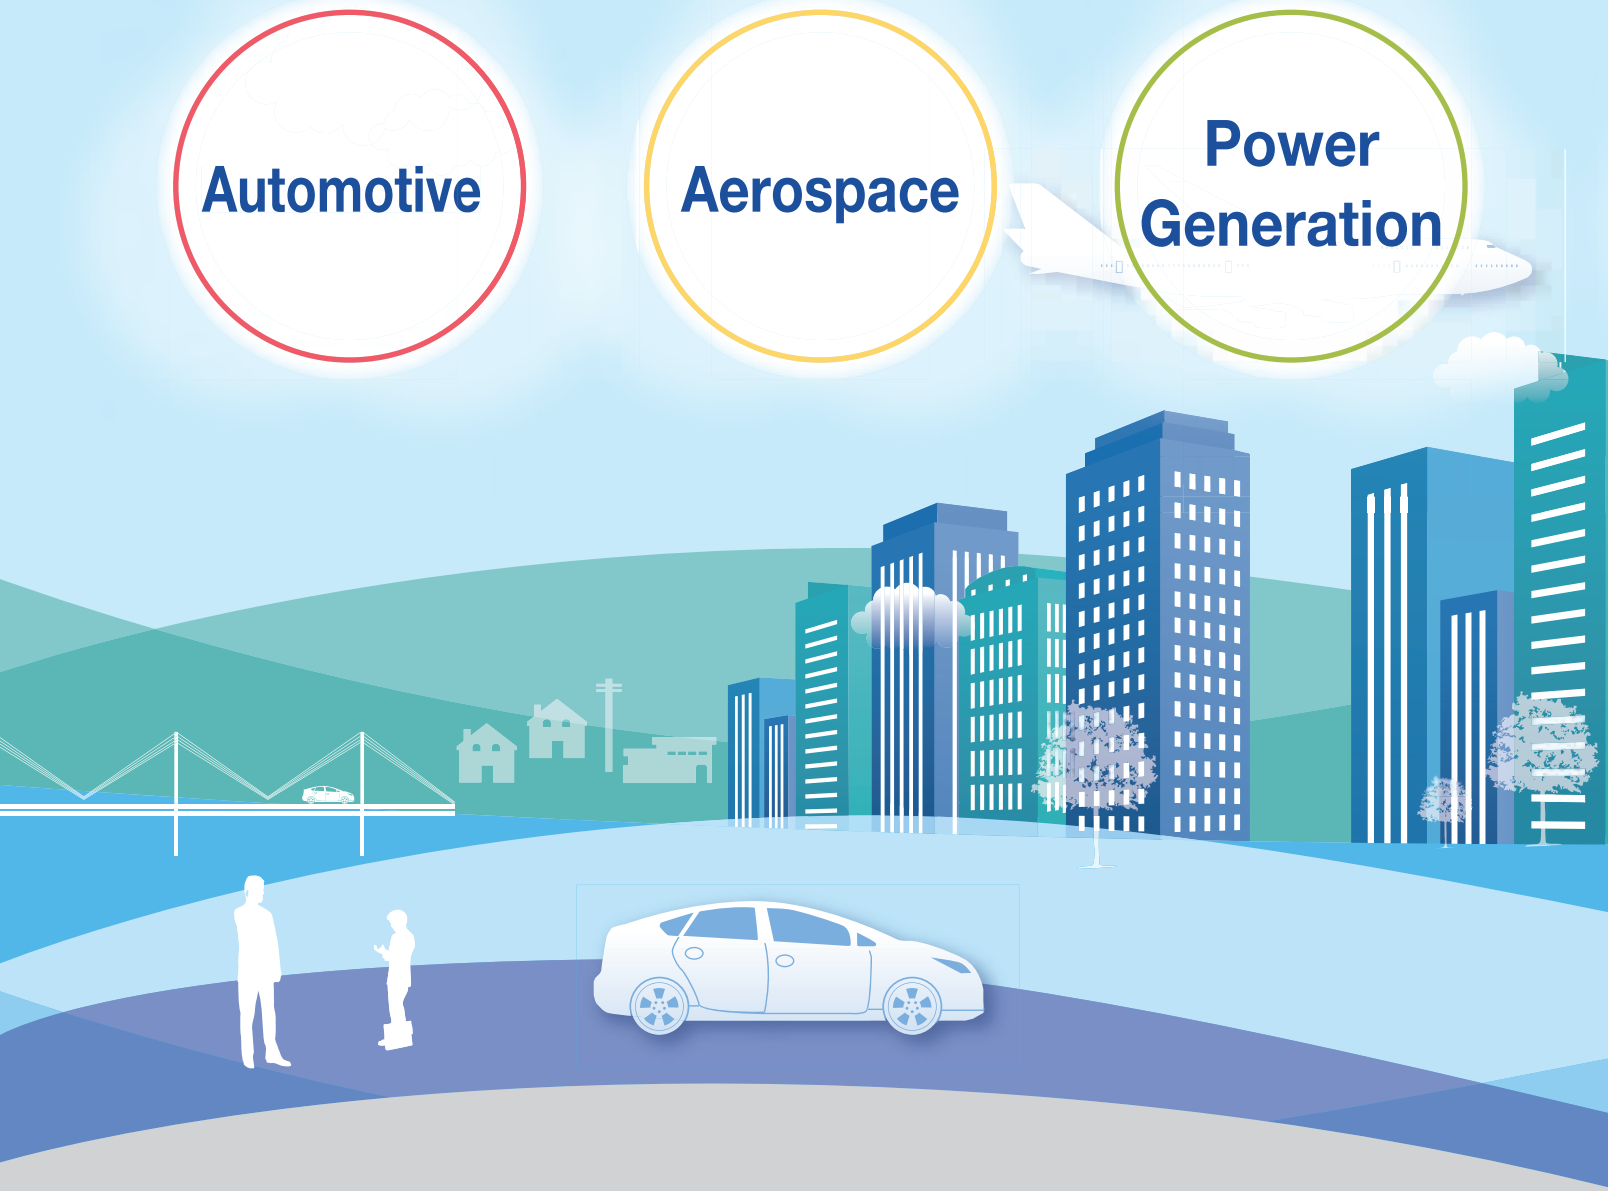
Sumitomo's Innovative Tools

Sumitomo Electric promises to understand the needs of our customers and use outstanding creativity to provide excellent products and services that are safe, socially useful and satisfy the needs of all of our customers, including quality and affordability, while also supporting people's daily lives.



Provide Support for Daily Lives

Carbide Tool Product Safety Pamphlet / Cutting Tool Edition

Sumitomo Electric Hardmetal pursues product manufacturing with a focus on both quality and safety.
Take note of each of the following points when using IGETALLOY, SUMIBORON or SUMIDIA products for safe use.

1. Carbide Tool Product Usage

Be sure to read this pamphlet thoroughly before handling or using any kind of carbide tool product or carbide tool material. Furthermore, as part of your employee safety training, make sure that all staff are well aware of the contents of this pamphlet.

2. Basic Characteristics of Carbide Tool Materials

2-1. Understanding the Terminology in this Pamphlet

Carbide Tool Material: Overall name for tool materials such as cemented carbide, cermet, ceramics, CBN, and polycrystalline diamond.
Cemented Carbide: Tool material using WC (tungsten carbide) as the main constituent
Carbide: Nickname for carbide tool materials. In a narrow sense, it is used as an abbreviation of cemented carbide.
Carbide Tool: Overall name for tools that use carbide tool materials

2-2. Physical Characteristics

Appearance: Depends on the material. Ex: Gray, black, gold, etc.
Smell: Odourless
Hardness: Carbide / cermet Hv5 to 30GPa, ceramics Hv10 to 40GPa
CBN Hv20 to 50GPa, polycrystalline diamond Hv80 to 120GPa
Specific Gravity: Carbide 9 to 16, cermet 5 to 9, ceramics 2 to 7, CBN and polycrystalline diamond 3 to 5

2-3. Constituents

Carbides, nitrides, carbon nitrides and oxides of W, Ti, Al, Si, Ta, and B, in addition to alloys containing Co, Ni, Cr, Mo and other constituents.

3. Precautionary Notes for Handling Carbide Tool Materials

- While carbide materials are extremely hard, they also possess characteristics of brittle materials. Accordingly, they may break if subjected to shock or if excessive tightening force is applied.
- Carbide materials have a high specific gravity: if the product is large or there are many items, they should be handled carefully as heavy items.
- Carbide materials have a different rate of thermal expansion from metal materials. Therefore, if the operating temperature is much higher (or lower) than the designed value, hot-fit/cool-fit (shrink fit) tools may crack.
- Carbide materials may corrode in liquids such as grinding fluid or lubricant, decreasing the strength of the tool. Consequently, store them with care.

4. Precautionary Notes on the Use of Carbide Tools

- The strength of carbide tools can be drastically reduced if the surface shape is changed. Always use a diamond grindstone for finishing.
- Carbide tools generate cutting dust when cutting. There may be harmful physical effects if a large amount is inhaled. Install a ventilation device and wear a protective mask and gloves when using the tool. If the dust gets on the skin or in the eyes, immediately wash out and rinse with water.
- If discarding lubricant used when grinding carbide materials or brazed products, the liquid will contain heavy metal constituents and should be discarded appropriately.
- When regrinding a carbide tool, check that no cracks have formed after regrinding is complete.
- Cracks may form if attempting to mark carbide materials and products with a laser or electric pen. Make sure areas where stress is applied are not marked.
- Residual cracks will form on the surface if electrical discharge machining carbide materials, decreasing the strength. If EDM is required, completely grind away these cracks.
- If brazing carbide materials, take care as if the temperature of the brazing material is too hot or too cold the carbide may come loose or become damaged.

■ Precautionary Notes on the Use of Cutting Tools

Product Line	Dangers	Countermeasures
General Cutting Tools	◎ As the tools have sharp cutting edges, you may cut your hands if they come into direct contact with the edges.	* Please use gloves and other protective gear, especially when removing a product from its case or mounting it onto a machine.
	◎ Incorrect use or inappropriate application conditions could result in injuries caused by tool breakage or projectiles.	* Use safety covers, safety glasses and other protection measures. * Always operate within recommended conditions. Please refer to the instruction manuals or catalogues.
	◎ If there is a sharp increase in cutting force due to high impact loads or excessive wear, injuries may result from tool breakage or projectiles.	* Use safety covers, safety glasses and other protection measures. * Replace the tools before the indicated product lifetimes expire.
	◎ High temperature chips or lengthy chips being discharged may cause injuries or burns.	* Use safety covers, safety glasses and other protection measures. * When clearing chips, please wear safety gloves and use an appropriate tool.
	◎ Both the tool and work material will heat up during machining. Burns may occur if touched with bare hands immediately after machining operations.	* Use gloves and other protective measures, especially when removing products from their cases.
	◎ Chips may ignite or catch fire from sparks during machining or from heat produced from breakage.	* Please do not use this product in places where there are highly flammable or highly explosive materials. * If non-water-soluble coolant is used, precautions against fire must be taken beforehand.
	◎ At high rotational speeds, injuries may result from tool breakage if the cutter (including the machine tool jig) is not balanced or if there is runout vibration.	* Use safety covers, safety glasses and other protection measures. * Please perform a dry run to ensure that there is no vibration or abnormal noises.
	◎ Burrs formed on workpieces are sharp and may cause injuries.	* Do not handle with bare hands.
General Indexable Insert Tools	◎ If inserts or holder parts are not clamped properly, they may drop off or be flung out during machining.	* Remove any foreign particles and clean all contact and clamping parts before mounting the inserts. * Check that inserts and parts have been properly clamped for mounting. Use wrenches provided for securing. Do not use inserts or parts not specified by the manufacturer.
	◎ Using pipes to aid tightening may cause insert or tool breakage as a result of over tightening.	* Do not use tightening aids such as pipes, etc. Use the included wrench.
	◎ The use of tools at high speeds is dangerous, as inserts may be flung out due to centrifugal force. Take extra care when handling very small drills.	* Always operate within recommended conditions. Please refer to the instruction manuals or catalogues.
Milling Cutters	◎ As the cutters have sharp cutting edges, you may cut your hands if they come into direct contact with the edges.	* Please use gloves and other protective measures, especially when removing products from their cases.
	◎ Injuries may result from tool breakage or projectiles if there is rotational imbalance in the cutter, which causes wobbling or vibrations.	* Rotational speeds should be kept within recommended conditions. * Regular maintenance should be performed to maintain the rotational balance and accuracy of the machine's spindle bearings. Worn bearings will lead to rotational imbalance and runout.
Drills	◎ When using rotary tools to perform through hole drilling, disc-shaped chips may be flung out at high speeds. Be careful, as the disc has extremely sharp edges.	* Use safety covers, safety glasses and other protection measures. A cover must also be mounted on the chuck.
	◎ Drills with very small diameters have sharp tips and will prick the fingers. Surgery will be required if the drills break inside the finger. Drills may also scatter when fractured. Drills may also scatter shards when fractured.	* Take extra care when handling very small drills. Use gloves and other protective gear such as safety glasses.
Brazed Tools	◎ Injuries may result from a dislodged insert or from tool breakage.	* Please ensure that tools have been properly brazed before use. * Please do not use the product under high-temperature conditions.
Others	◎ Tools that have been repeatedly brazed run a risk of breaking easily while in use.	* Do not use tools that have been brazed repeatedly, as their strength will be lowered.
	◎ There is a danger of breakages and even injuries if machines and tools are used for applications other than their intended uses.	* Always conform to the regulations specified for intended use.

Closing Notes

The content of this pamphlet covers only basic instructions for precautionary measures. For more details, please refer to the specific instruction manual and catalog of the respective tools or contact us directly.
Sumitomo Electric Hardmetal Corp. shall not be liable for any injuries sustained from any unauthorized modifications made to the original tool specifications.
